(Greek *schizein*, to split, + *achyron*, chaff, alluding to the cleft apex of the fertile lemma) Tufted or rhizomatous annuals and perennials, with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat to rolled blades, and lacking auricles. **INFL** a cluster of spicate racemes (rame), each subtended by a narrow spathe and composed of repeating pairs of sessile and pedicelled spikelets; disarticulation below the glumes, a unit composed of the sessile spikelet, rachis joint, pedicel, and pedicelled spikelet. **SPIKELETS** in pairs of 1 sessile and 1 pedicelled. **SESSILE SPIKELETS** perfect and fertile, with 2 florets; glumes exceeding the florets, stiff-membranous; lower floret reduced to a sterile hyaline lemma; upper floret fertile, hyaline, 2-cleft, awned from the sinus. **STAMENS** 3. **PEDICELLED SPIKELETS** usually shorter and smaller than the sessile spikelet, with 1 floret, sterile or staminate, often disarticulating at maturity; lemma hyaline, awnless or short-awned. $x = 10$. About 60 species in the tropical, subtropical, and warm-temperate regions of the world (Gould 1967).

Schizachyrium scoparium (Michx.) Nash (broomlike) Little bluestem. Tufted perennials (ours), sometimes producing short rhizomes. **CULMS** erect, often grooved above the nodes, 45–100 cm tall or more. **LIGULES** 0.5–3 mm long. **BLADES** flat or folded, 1.5–5 mm wide. **FLOWERING SHOOTS** about 1/2–2/3 as long as the culms; racemes 3–5 cm long, with 7–12 spikelets. **SESSILE SPIKELETS** 6–11 mm long, the callus hairs to 3 mm long; awn 5–17 mm long. **PEDICELLED SPIKELETS** 1–6 mm long, sterile, mostly lacking a lemma and awnless. $2n = 40$. [*Andropogon scoparius* Michx.; *Andropogon scoparius* Michx. var. *frequens* F. T. Hubb.]. Canyons and rocky slopes. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin; NMEX: McK, RAr, San, SJn; UTAH. 1700–2350 m (5600–7700'). Flowering: Jul–Sep. Canada to central Mexico, absent from the far western states. Our plants belong to **var. *scoparium***.

Secale L. Rye

(classical Latin name for rye) Tufted annuals (ours) and perennials, with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat blades, and prominent auricles. **INFL** a spike, the rachis persistent or disarticulating. **SPIKELETS** 1 per node, 2-flowered, the rachilla prolonged beyond the upper floret and sometimes bearing a rudiment; disarticulation in the rachis or above the glumes and between the florets (ours mostly) or not at all; glumes narrow, rigid, shorter than the lemmas; lemmas 5-nerved, asymmetrically keeled, strongly ciliate, tapering to a long scabrous awn; palea 2-nerved. **STAMENS** 3. $x = 7$. A small genus of three species native to Eurasia (Frederiksen and Petersen 1998).

Secale cereale L. (a grain) Rye. Robust tufted annuals or occasionally biennials. **CULMS** 40–120 cm or more tall. **LIGULES** 0.5–2 mm long. **BLADES** 3–10 mm wide, the auricles about 1 mm long. **SPIKES** 4–18 cm long, often nodding when mature. **GLUMES** 1-nerved, ciliolate on the keel, equal, 8–20 mm long, nearly linear. **LEMMAS** 12–18 mm long, strongly ciliate on the keel; awns 10–50 mm long. **PALEAS** about as long as the lemmas. **ANTHERS** 7–9 mm long. $2n = 14, 16, 27–29$. Introduced as a cultivated crop, and also widely used for erosion control along roadsides, occasionally escaping around fields, but not persisting long. ARIZ: Nav; COLO: LPl, Mon; NMEX: SJn; UTAH. 1400–2400 m (4600–7800'). Flowering: May–Jul. Native to Eurasia, now found widely throughout Canada and the United States, and somewhat in Mexico, also South America. This is one of the world's most important cereal grasses but is also susceptible to ergot infestation by the fungus *Claviceps purpurea*. Hybrids between this and wheat are known as ×*Triticosecale* (triticale).

Setaria P. Beauv. Bristlegrass

(Latin *seta*, bristle, + *aria*, possessing) Tufted annuals and perennials (rarely rhizomatous), with hollow or pithy culms. **LEAVES** with open sheaths, membranous or hairy ligules, flat to rolled blades, and lacking auricles. **INFL** a terminal panicle, the branches usually highly reduced and the panicle spikelike; disarticulation below the glumes, the bristles persistent on the plant. **SPIKELETS** subtended by 1–several bristles (sterile branchlets), 2-flowered, dorsally compressed, awnless, the lower floret reduced, the upper floret perfect; glumes unequal, the first much smaller than the second; lower floret staminate or sterile, the lemma membranous and similar in size and texture to the second glume;

upper floret perfect, the lemma and palea forming a hard seedcase around the flower and grain. **STAMENS** 3. $x = 9$. About 140 species of tropical to warm-temperate regions of the world. *Setaria vulpiseta* Roem. & Schult. has been reported from the *Flora* area, but that name is restricted to South America and should not be confused with our North American *Setaria* (Rominger 1962; Toolin and Reeder 2000).

1. Margins of the sheaths glabrous; second glume about 1/2 the length of the adjacent upper lemma, which is easily visible; upper lemma strongly wrinkled ..... ***S. pumila***
1' Margins of the sheaths pubescent; second glume about the same length as the adjacent upper lemma, which is scarcely visible; upper lemma only faintly wrinkled ..... ***S. viridis***

Setaria pumila (Poir.) Roem. & Schult. (dwarfish, pygmy) Yellow bristlegrass. Tufted annuals. **CULMS** erect to geniculate-based or decumbent, sometimes rooting at the lower nodes, 25–100 cm tall or more. **LIGULES** a ciliate membrane, 0.3–1.2 mm long. **BLADES** flat, 3–8 mm wide, usually papillose-pilose near the throat. **PANICLES** yellowish, erect, densely spicate, 3–15 cm long; bristles 4–12 below each spikelet, 3–8 mm long. **SPIKELETS** 2–3.4 mm long, turgid. **FIRST GLUME** about 1/3 the length of the spikelet, 3-nerved. **SECOND GLUME** about 1/2 the length of the spikelet, 5-nerved. **LOWER FLORET** sterile or often staminate, the lemma equaling the upper lemma. **UPPER FLORET** conspicuously exposed, strongly rugose, 2.3–3.2 mm long; anthers 0.5–1.5 mm long. $2n = 36, 72$. [*Setaria glauca* of numerous authors; *Setaria lutescens* (Weigel) F. T. Hubbard]. Weedy ground along roads, fields, and in lawns. ARIZ: Nav; NMEX: SJn; UTAH. 1300–1700 m (4300–5600'). Flowering: Jul–Sep. Native to Europe and common throughout North America and warm-temperate regions of the world.

Setaria viridis (L.) P. Beauv. (green) Green bristlegrass. Tufted annuals. **CULMS** decumbent-based and ascending above, 10–100 cm tall or more. **LIGULES** a ciliate membrane, 1–2 mm long. **BLADES** flat, 4–20 mm wide, glabrous near the throat. **PANICLES** green, nodding only at the tip, densely spicate, 3–20 cm long; bristles 1–3 below each spikelet, 5–10 mm long. **SPIKELETS** 1.8–2.2 mm long. **FIRST GLUME** about 1/3 the length of the spikelet, 3-nerved. **SECOND GLUME** about as long as the spikelet, 5- to 6-nerved. **LOWER FLORET** sterile, the lemma slightly exceeding the upper lemma. **UPPER FLORET** finely rugose, pale green, 1.8–2.5 mm long; anthers 0.5–0.7 mm long. $2n = 18, 35, 36$. A common weed of roadsides, lawns, flower beds, and other disturbed areas, widespread. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Min, Mon, SJn; NMEX: McK, RAr, San, SJn; UTAH. 1500–2400 m (4900–7900'). Flowering: Jun–Sep. Native to Europe and common throughout North America and warm-temperate regions of the world.

Sorghastrum Nash

(*Sorghum*, a grass genus, and Latin *astrum*, a poor imitation of, alluding to the resemblance) Tufted perennials, with or without rhizomes, the culms hollow or pithy. **LEAVES** with open sheaths, the upper margins projecting into erect sheath auricles, and flat blades. **INFL** a rebranching panicle, narrow but loose. **SPIKELETS** borne in pairs of 1 sessile and 1 pedicelled, the pedicelled spikelet reduced and completely absent, all the spikelets present thus sessile, 2 pedicels present at the ends of the branches; disarticulation below the glumes and consisting of the sessile spikelet, rachis joint, and pedicel. **SESSILE SPIKELETS** perfect, 2-flowered; glumes coriaceous, exceeding the florets, the first glume pubescent on the back, the second glume glabrous; lower floret sterile and reduced to a hyaline lemma; upper floret perfect, the lemma hyaline, bifid, and awned from the sinus. **STAMENS** 3. $x = 10$. About 18 species, all but 2 native to the Americas.

Sorghastrum nutans (L.) Nash (nodding) Indiangrass. Tufted perennials from short, stout rhizomes. **CULMS** erect, 50–150 cm tall or more, the nodes hirsute with erect hairs. **LIGULES** 2–6 mm long. **BLADES** 1–4 mm wide. **PANICLES** 20–75 cm long, yellowish to brownish. **SPIKELETS** 5–9 mm long. **FIRST GLUME** 7- to 9-nerved, 5–8 mm long, pubescent across the back. **SECOND GLUME** 5-nerved, 5–8 mm long, glabrous. **LOWER FLORET** sterile, 4–5 mm long. **UPPER FLORET** 4.5–6.5 mm long; awn 10–30 mm long, once-geniculate. $2n = 20, 40, 80$. Open woods, grassy plains, moist rocky hillsides. ARIZ: Apa; COLO: Arc, LPl; NMEX: McK, RAr, SJn; UTAH. 1700–2200 m (5600–7200'). Flowering: Aug–Sep. From Canada to Mexico in the Rocky Mountain states and eastward, one of the main grasses of the tallgrass prairie.

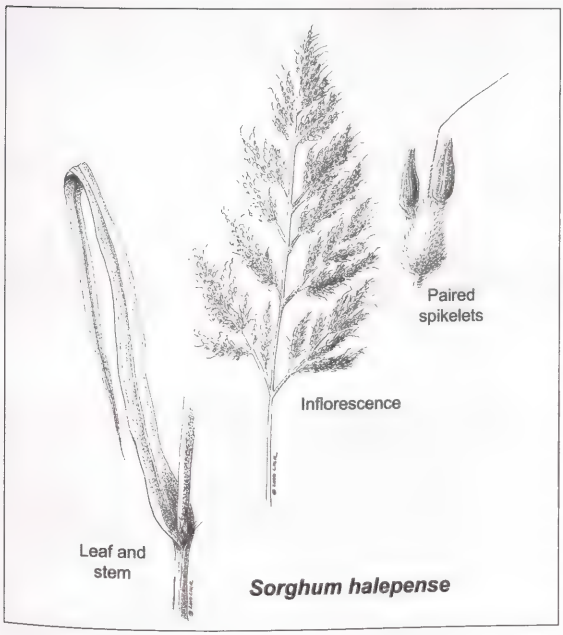
Sorghum Moench Sorghum, Johnson Grass

(Latinized from *sorgo*, the Italian name of the plant) Tufted annuals to rhizomatous perennials with hollow to pithy culms. **LEAVES** with open sheaths, membranous ligules, flat blades, and lacking auricles. **INFL** a large rebranching panicle, open to compact. **SPIKELETS** borne in pairs of 1 sessile and 1 pedicelled, 2 pedicels present at the ends of the branches; disarticulation below the glumes and consisting of the sessile spikelet, rachis joint, and pedicelled

spikelet. **SESSILE SPIKELETS** perfect, 2-flowered, dorsally compressed; glumes coriaceous, exceeding the florets, the first glume 5- to 15-nerved and awnless, the second glume 2-keeled and sometimes awned; lower floret sterile and reduced to a hyaline lemma; upper floret pistillate or perfect, the lemma hyaline, and sometimes awned. **STAMENS** 3. **PEDICELLED SPIKELETS** staminate or sterile, nearly as large as the sessile spikelet. $x = 10$. About 25 species of tropical and subtropical regions, most native to the Old World (Doggett 1970; Spangler 2000).

1. Plants robust annuals, lacking rhizomes; panicle branch segments persistent and not breaking apart easily, or tardily disarticulating ..... ***S. bicolor***
1′ Plants perennial, with strong rhizomes; panicle branch segments breaking apart easily ..... ***S. halepense***

Sorghum bicolor (L.) Moench (two-colored) Sorghum, milo. Robust tufted annuals. **CULMS** 75–200 cm tall or more. **LIGULES** 1.5–5.5 mm long. **BLADES** flat, 15–50 mm wide. **PANICLES** 10–60 cm long, open or densely contracted, 5–25 cm wide. **SESSILE SPIKELETS** perfect, lanceolate to ovate, 3–9 mm long; glumes glabrous to pubescent; lower floret sterile, 3.8–5 mm long; upper floret fertile; awn 5–20 mm long; anthers 2–2.8 mm long. **PEDICELLED SPIKELETS** staminate or sterile, usually shorter and thinner than the sessile spikelets. $2n = 20, 40$. A cultivated crop and sometimes escaping but not persisting long. NMEX: SJn. 1400–1700 m (4600–5500′). Flowering: Jul–Sep. Native to Eurasia and cultivated in many parts of the world. There are numerous races and cultivated forms, all interfertile; these include grain sorghum, sweet sorghum, sorgo, pop sorghum, broomcorn sorghum, and sudangrass.



Sorghum halepense (L.) Pers. (from Aleppo, Turkey) Johnson grass. Plants rhizomatous perennials. **CULMS** 50–150 cm tall or more. **LIGULES** 2–6 mm long, conspicuously ciliate. **BLADES** flat, 8–40 mm wide. **PANICLES** 10–50 cm long, open, 5–25 cm wide. **SESSILE SPIKELETS** lanceolate to ovate, 3.5–6.5 mm long; glumes appressed-pubescent; lower floret sterile, 4–4.5 mm long; upper floret fertile, awnless or with an awn to 13 mm long; anthers 1.9–2.7 mm long. **PEDICELLED SPIKELETS** staminate, nearly as long as the sessile spikelets, but narrower, 3.6–5.6 mm long; awnless. $2n = 20, 40$. An aggressive weed of fields, pastures, ditches, and moist waste places. ARIZ: Apa; COLO: LPl; NMEX: McK, San, SJn; UTAH. 1200–2050 m (3900–6700′). Flowering: Jul–Sep. Native to Eurasia and now found throughout the warm regions of the world. Johnson grass may accumulate cyanide under stress conditions and become toxic to livestock, but it can also provide valuable forage if cured properly. The name remembers William Johnson of Alabama, who was active in promoting this grass for forage in the mid-1800s.

Spartina Schreb. Cordgrass

[Greek *spartine*, a cord made from *Spartium junceum* (a legume), alluding to the cordlike blades of some species] Strongly rhizomatous perennials with hollow culms. **LEAVES** with open sheaths, hairy ligules, flat to rolled blades, and lacking auricles. **INFL** a panicle of few to many spicate unbranched branches. **SPIKELETS** 1-flowered, strongly compressed, disarticulating above the glumes; glumes unequal, 1- to 3-nerved, awnless or awned, the first shorter than the floret, the second longer than the floret; lemma 1- to 3-nerved, awnless; palea 2-neved. **STAMENS** 3. $x = 10$. About 15 or so species, all from wetlands, marshes, and estuaries, both coastal and interior. Some species can be invasive.

Spartina gracilis Trin. (slender) Alkali cordgrass. Strongly rhizomatous perennials. **CULMS** not clustered but usually solitary, 30–75 cm tall. **LIGULES** 0.5–1.5 mm long. **BLADES** flat, becoming involute upon drying, 3–5 mm wide,

scabrous on the margins. **PANICLES** 8–20 cm long; branches appressed to the main axis, 2–8 in number, 2–5 cm long. **SPIKELETS** densely crowded and appressed on the branch, 18–25 per branch. **GLUMES** noticeably ciliate on the keels, the first 3.5–6 mm long, the second 7–10 mm long. **LEMMAS** 1-nerved, 6–8 mm long, blunt, the keel ciliate. **PALEAS** subequal to the lemmas. **ANTHERS** 2.5–5 mm long. $2n = 40, 42$. Wet meadows and alkaline lakeshores. UTAH. 1350–1550 m (4400–5100'). Flowering: Jun–Sep. Central Canada westward and southward to California and New Mexico.

Sphenopholis Scribn. Wedgescale

(Greek *sphen*, a wedge, + *pholis*, scale, alluding to the shape of the second glume) Tufted annuals or short-lived perennials with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat blades, and lacking auricles. **INFL** a panicle, usually contracted. **SPIKELETS** (1) 2- to 3-flowered, the florets perfect, the rachilla prolonged beyond the upper floret, awnless; disarticulation below the glumes, the spikelet falling as a unit; glumes dissimilar in size and shape, the first glume narrow and 1-nerved, the second glume broader, oblanceolate, and 3-nerved, shorter than the lowermost lemma; lemmas faintly 5-nerved, rounded on the back, awnless; palea shorter than the lemma, 2-nerved. **STAMENS** 3. $x = 7$. A small genus of four species in North America (Erdman 1965).

Sphenopholis obtusata (Michx.) Scribn. (blunt) Prairie wedgescale. Tufted annuals or short-lived perennials. **CULMS** erect, 30–70 cm tall. **LIGULES** erose-ciliate, 1.5–3.5 mm long. **BLADES** flat, 1.5–6 mm wide. **PANICLES** narrow, spicate, interrupted below, green, 4–18 cm long, about 2 cm wide, the rachis and pedicels glabrous. **SPIKELETS** 1.5–5 mm long. **GLUMES** unequal, the first 1.7–3 mm long and linear, the second 2–3 mm long and obovate, somewhat hood-shaped, about 2/3 the length of the spikelet. **LEMMAS** lanceolate, 2–3 mm long. **PALEAS** shorter than the lemmas. **ANTHERS** 0.3–0.7 mm long. $2n = 14$. Moist or wet ground along springs, seeps, streams, ditches, and canals. ARIZ: Apa, Nav; COLO: Arc, LPl, Mon; NMEX: SJn; UTAH. 1370–2100 m (4500–6800'). Flowering: Jul–Sep. Throughout North America. This is often confused with *Koeleria macrantha*, but that species has puberulent panicle rachises and pedicels, much larger glumes, and usually tan-colored panicles.

Sporobolus R. Br. Dropseed

(Greek *spora*, seed, + *ballein*, to throw, alluding to the fact that the grain is not fused to the ovary, allowing it to drop from the spikelet) Tufted annuals and perennials, lacking rhizomes, with pithy or hollow culms. **LEAVES** with open sheaths, hairy or membranous ligules fringed with hairs, flat to rolled blades, and lacking auricles. **INFL** a rebranched panicle, narrow and spikelike to open and diffuse. **SPIKELETS** 1-flowered, small, awnless, the rachilla not prolonged beyond the floret, mostly disarticulating above the glumes and also the seed separating from the pericarp; glumes 1-nerved, scarious, often unequal, at least one shorter than the floret; lemma 1-nerved, scarious; palea 2-nerved, nearly as long as the lemma. **STAMENS** 3. $x = 6, 9$. A large genus of 160 or more species growing throughout the world in tropical to temperate habitats.

1. Plants small, slender annuals or short-lived perennials, mostly less than 35 cm tall; culms geniculate ..... (2)
1' Plants usually stout perennials, mostly more than 35 cm tall; culms erect to decumbent-based ..... (3)

2. Lower nodes of the panicle with 7–12 whorled branches; glumes very unequal; panicles narrow when in flower and open at maturity ..... ***S. pyramidatus***
2' Lower nodes of the panicle with 1–3 branches; glumes equal or nearly so; panicles narrow, the lower branches often included in the subtending sheath ..... ***S. neglectus***

3. Exserted portion of the panicle dense and spikelike, 1–3 (4) cm wide, the branches erect-appressed, often scarcely discernible at arm's length ..... (4)
3' Exserted portion of the panicle loosely contracted to diffuse, 3–30 cm wide, the branches ascending to widely diverging, easily discernible at arm's length ..... (6)

4. Flowering shoots with both terminal and axillary panicles, the latter often hidden in the sheaths; spikelets large, 4–6 mm long; anthers 1.5–2.5 mm long ..... ***S. compositus***
4' Flowering shoots with only terminal panicles; spikelets smaller, 1–3 mm long; anthers 0.4–1.5 mm long ..... (5)

5. Culms robust, 1–2 m tall, 3–8 mm thick at the base; anthers 0.6–1 mm long ..... ***S. giganteus***
5' Culms more slender, mostly less than 1 m tall, 1.5–3.5 (4) mm thick at the base; anthers 0.3–0.5 mm long ..... ***S. contractus***

6. Sheaths with many long hairs at the summit; plants more slender, the shoots easily pulled from the ground, the basal sheaths not shiny, often darkened, the roots thin ..... (7)
6' Sheaths glabrous or with only a few long hairs at the summit; plants robust, the shoots difficult to pull from the ground, the basal sheaths shiny and cream-colored, the roots thick ..... (8)

7. Mature panicle branches and pedicels divaricate and flexuous, usually tangled with other branches or other panicles; branch pulvini pubescent; spikelets loosely arranged on the branches ..... ***S. flexuosus***
7' Mature panicle branches erect to spreading but not flexuous or tangled; branch pulvini glabrous; spikelets crowded on the branches ..... ***S. cryptandrus***

8. Panicles 10–45 cm long; branchlets naked below, the pedicels 0.5–2 mm long, often spreading ..... ***S. airoides***
8' Panicles 20–60 cm long; branchlets densely flowered to the base, the pedicels less than 0.5 mm long, appressed to the branchlets ..... ***S. wrightii***

Sporobolus airoides (Torr.) Torr. (resembling the grass genus *Aira*) Alkali sacaton. Densely tufted, robust perennials without rhizomes, the basal sheaths thick and shiny, cream-colored. **CULMS** 35–150 cm tall, usually hollow. **LIGULES** 0.1–0.3 mm long. **BLADES** flat to involute, 2–5 mm wide, the collar glabrous or sparsely hairy. **PANICLES** diffuse, 10–45 cm long, 10–25 cm wide, the branches widely spreading, the branchlets naked below, the pulvini glabrous. **SPIKELETS** 1.3–2.8 mm long, greenish or purple-tinged. **GLUMES** unequal, the first 0.5–1.8 mm long, the second 1.1–2.8 mm long and at least 2/3 as long as the floret. **LEMMAS** 1.2–2.5 mm long, glabrous. **PALEAS** subequal to the lemmas. **ANTHERS** 1.1–1.8 mm long, yellowish to purplish. $2n = 80, 90, 108, 126$. Low alkaline plains, flats, playas, and washes. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1450–2080 m (4800–6800'). Flowering: Jun–Aug. Central and western plains and mountain states, into Mexico.

Sporobolus compositus (Poir.) Merr. (put together, joined) Tall dropseed. Stout tufted perennials, frequently with sharp-pointed basal buds, without short rhizomes (ours). **CULMS** erect, stout, 30–130 cm tall, 2–5 mm thick. **LIGULES** 0.1–0.5 mm long. **BLADES** flat to involute, 2–5 mm wide, the collars sparsely hairy. **PANICLES** terminal and axillary, usually spikelike, 8–30 cm long, less than 2 cm wide, the branches erect-appressed, the pulvini glabrous. **SPIKELETS** 4–6 mm long. **GLUMES** subequal, the midnerves usually greenish, 2–5 mm long, about as long as the lemma. **LEMMAS** 2.5–6 mm long, glabrous, mostly 1-nerved, but sometimes with 2 or 3 nerves. **PALEAS** about as long as the lemmas. **ANTHERS** 0.5–3.2 mm long, yellow to orange. $2n = 54, 88, 108$. [*S. asper* (P. Beauv.) Kunth]. Sandy plains and roadsides, deserts and foothills. NMEX: SJn. 1450–1900 m (4800–6200'). Flowering: Aug–Sep. Throughout most of the United States from the eastern coast to Utah and Arizona.

Sporobolus contractus Hitchc. (contracted) Spike dropseed. Tufted perennials. **CULMS** 40–100 (120) cm tall, 2–4 mm thick near the base. **LIGULES** 0.4–1 mm long. **BLADES** flat to rolled, 3–8 mm wide, the collars with conspicuous tufts of long hairs. **PANICLES** all terminal, spikelike, 15–45 cm long, less than 1 cm wide, the base usually included in the sheath, the pulvini glabrous. **SPIKELETS** 1.7–3.2 mm long. **GLUMES** unequal, the first 0.7–1.7 mm long, the second 2–3.2 mm long, at least 2/3 the length of the lemma. **LEMMAS** 2–3.2 mm long, glabrous. **PALEAS** slightly shorter than the lemmas. **ANTHERS** 0.3–0.5 mm long. $2n = 36$. Sandy ground in desert and foothill communities. ARIZ: Apa, Coc, Nav; NMEX: McK, RAr, San, SJn; UTAH. 1400–2025 m (4600–6600'). Flowering: Jun–Sep. Southwestern United States to northern Mexico.

Sporobolus cryptandrus (Torr.) A. Gray (hidden man or stamen) Sand dropseed. Tufted perennials, the bases not hard and knotty. **CULMS** 30–100 cm or more tall, erect to decumbent-based. **LIGULES** 0.5–1 mm long. **BLADES** flat to rolled, 2–6 mm wide, the collars with conspicuous tufts of long hair. **PANICLES** terminal, spikelike when emerging from the sheath, ultimately loosely open when mature, 15–40 cm long, 3–12 cm wide, the base often included in the sheath or the entire panicle sometimes enclosed in the sheath, the pulvini glabrous. **SPIKELETS** 1.5–2.7 mm long. **GLUMES** unequal, the first 0.6–1.1 mm long, the second 1.5–2.7 mm long and at least 2/3 the length of the lemma. **LEMMAS** 1.4–2.5 mm long, glabrous. **PALEAS** slightly shorter than the lemmas. **ANTHERS** 0.5–1 mm long, yellowish to purplish. $2n = 36, 38, 72$. Sandy plains and mesas, roadsides, waste places, deserts to the mountains. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Min, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1200–2500 m (4000–8200'). Flowering: Jun–Sep. Nearly throughout North America.

Sporobolus flexuosus (Thurb. ex Vasey) Rydb. (bent, curved, flexuous) Mesa dropseed. Tufted perennials, the bases not hard and knotty. **CULMS** 30–100 cm or more tall, erect to decumbent-based. **LIGULES** 0.5–1 mm long. **BLADES** flat to rolled, 2–5 mm long, the collars with conspicuous tufts of long hair. **PANICLES** terminal, open, 10–30 cm long,

4–12 cm wide, the base often included in the sheath, the pulvini prominent and pubescent. **SPIKELETS** 1.8–2.5 mm long. **GLUMES** unequal, the first 1–1.5 mm long, the second 1.4–2.5 mm long and about as long as the lemma. **LEMMAS** 1.4–2.5 mm long. **PALEAS** as long as the lemmas. **ANTHERS** 0.4–0.7 mm long, yellowish. $2n = 36, 38$. Sandy to gravelly plains and mesas, roadsides, desert scrub and woodland communities. ARIZ: Apa, Coc, Nav; COLO: Mon; NMEX: McK, SJn; UTAH. 1350–1750 m (4400–5800'). Flowering: Jun–Sep. Southwestern United States and northern Mexico.

Sporobolus giganteus Nash (gigantic, mighty) Giant dropseed. Tufted robust perennials. **CULMS** 1–2 m tall, 4–10 mm thick near the base. **LIGULES** 0.5–1.5 mm long. **BLADES** flat, 4–10 mm wide, the collars with conspicuous tufts of long hair. **PANICLES** terminal, spikelike, dense, 25–75 cm long, 1–4 cm wide, the base often included in the sheath, the pulvini glabrous. **SPIKELETS** 2.5–3.5 mm long. **GLUMES** unequal, the first 0.6–2 mm long, the second 2–3.5 mm long, as long as the lemma. **LEMMAS** 2.5–3.4 mm long, glabrous. **PALEAS** about as long as the lemmas. **ANTHERS** 0.6–1 mm long, yellowish. $2n = 36$. Sandy hills and plains, dunes, desert communities. ARIZ: Apa, Nav; COLO: Mon; NMEX: McK, San, SJn; UTAH. 1200–1900 m (4000–6200'). Flowering: Jun–Sep. Southwestern United States and northern Mexico.

Sporobolus neglectus Nash (disregarded, not chosen) Puff-sheath dropseed. Tufted annuals, often much-branched, with inflated sheaths. **CULMS** geniculate, wiry, 10–40 cm tall. **LIGULES** 0.1–0.3 mm long. **BLADES** flat to loosely folded, 0.6–2 mm wide, the collars glabrous to sparsely hairy. **PANICLES** terminal and axillary, narrow and spikelike, 2–5 cm long, less than 1 cm wide, the base often included in the sheath, the lower nodes with 1–3 branches spikelet-bearing to the base. **SPIKELETS** 1.6–3 mm long. **GLUMES** subequal, shorter than the floret, 1.5–2.5 mm long. **LEMMAS** 1.6–3 mm long, glabrous. **PALEAS** as long as the lemmas. **ANTHERS** 1–1.6 mm long, purplish. $2n = 36$. Sandy fields, floodplains, disturbed ground. ARIZ: Apa; COLO: Arc, LPl; NMEX: SJn. 1550–2555 m (5100–8390'). Flowering: Aug–Sep. Scattered locales throughout southern Canada and the United States, most common in the central states. Plants are typically much-branched, with exposed nodes and numerous terminal and axillary panicles.

Sporobolus pyramidatus (Lam.) Hitchc. (pyramid-shaped) Whorled dropseed. Low, tufted annuals (ours) or short-lived perennials. **CULMS** in tight clumps, geniculate to ascending, 7–35 cm tall. **LIGULES** 0.3–1 mm long. **BLADES** flat, 2–5 mm wide, the collars glabrous to sparsely hairy. **PANICLES** terminal, closed during anthesis, open at maturity, 4–15 cm long, 0.5–6 cm wide, the primary branches with elongated glands, branchlets and spikelets appressed on the primary branch, the pulvini glabrous. **SPIKELETS** 1.2–1.8 mm long. **GLUMES** unequal, the first 0.3–0.7 mm long, the second 1.2–1.8 mm long and as long as the lemma. **LEMMAS** 1.2–1.7 mm long, translucent. **PALEAS** as long as the lemmas. **ANTHERS** 0.2–0.4 mm long, yellowish to purplish. **GRAINS** noticeably squarish, brownish. $2n = 24, 36, 54$. [*Sporobolus pulvinatus* Swallen]. Sandy or clay soils, disturbed ground, low flats and plains in desert communities. ARIZ: Apa, Nav; COLO: LPl; NMEX: McK, San, SJn; UTAH. 1500–1850 m (4900–6200'). Flowering: Jul–Sep. South-central and southwestern United States to Argentina. Our plants correspond to what was called *S. pulvinatus*, a smaller annual plant of the Southwest, as opposed to the more eastern and southern *S. pyramidatus*, which can be a short-lived perennial.

Sporobolus wrightii Munro ex Scribn. (for Charles Wright, 1811–1885, American botanical collector) Giant sacaton. Densely tufted, robust perennials without rhizomes, the basal sheaths thick and shiny, cream-colored. **CULMS** 1–2.5 m tall, usually hollow. **LIGULES** 0.5–1 mm long. **BLADES** mostly flat, 3–10 mm wide, the collar glabrous or sparsely hairy. **PANICLES** open and exserted, 20–60 cm long, 12–26 cm wide, the branches spreading, the branchlets appressed, the pulvini glabrous. **SPIKELETS** 1.5–2.5 mm long, greenish or purple-tinged. **GLUMES** unequal, the first 0.5–1 mm long, the second 0.8–2 mm long and at least 2/3 as long as the floret. **LEMMAS** 1.2–2.5 mm long, glabrous. **PALEAS** subequal to the lemmas. **ANTHERS** 1.1–1.3 mm long, yellowish to purplish. $2n = 36$. [*S. airoides* (Torr.) Torr. var. *wrightii* (Munro ex Scribner) Gould]. Alkaline flats and washes. NMEX: McK, SJn. 1500–1750 m (5000–5800'). Flowering: Jun–Aug. Southwestern United States to central Mexico. Small plants can be confused with tall *S. airoides*, but the panicle features usually hold.

Stipa L. Needlegrass

Recent studies in the *Stipeae* have resulted in the relegation of all North American members of *Stipa* to six segregate genera, keyed below, of which five occur in our flora. The genus *Stipa* remains solely a Eurasian taxon.

1. Palea hardened, longitudinally grooved and slightly longer than the lemma, protruding from between the lemma margins as a small point; lemma margins involute, fitting into the grooves of the palea ..... ***Piptochaetium*** (not in our flora)

1' Palea usually membranous, not grooved, shorter than or equaling the lemma, not protruding as a small point; lemma margins flat ..... (2)

2. Lemma margins strongly overlapping; palea less than 1/3 the length of the lemma, glabrous, lacking veins ..... ***Nassella***
2' Lemma margins not or only slightly overlapping; palea 1/3 to equaling the length of the lemma, always pubescent when short, sometimes glabrous when longer, 2-veined ..... (3)

3. Awns 6–20 cm long or more; glumes longer than 1.8 cm ..... ***Hesperostipa***
3' Awns 0.5–7.5 cm long, if longer than 6 cm then the glumes 1–1.5 cm long ..... (4)

4. Palea pubescent, the apex flat, the veins terminating below the apex; lemma coriaceous at maturity but not strongly indurate ..... ***Achnatherum***
4' Palea glabrous or pubescent, the apex appearing prow-tipped or pinched, the veins extending to the apex; lemma indurate at maturity ..... (5)

5. Florets dorsally compressed; lemma margins not overlapping, the palea exposed, at least in part .... ***Piptatherum***
5' Florets terete; lemma margins slightly overlapping, the palea hidden ..... ***Oryzopsis***

Torreyochloa G. L. Church Mannagrass

(for John Torrey, 1796–1873, celebrated New England botanist) Rhizomatous perennials of nonsaline wet places, with hollow culms and cross-septate sheaths, decumbent-based and often rooting at the nodes. **LEAVES** with open sheaths, membranous ligules, flat blades, and lacking auricles. **INFL** a terminal panicle. **SPIKELETS** with 2–8 florets, laterally compressed to nearly terete, pedicelled, awnless; disarticulation above the glumes and between the florets; glumes nearly equal to unequal, shorter than the lowermost lemma, 1- to 3-nerved; lemmas 7- to 9-nerved, the nerves ± parallel and not converging at the apex and scaberulous; palea about as long as the lemma, 2-nerved. **STAMENS** usually 3. $x = 7$. A small genus of four species, two from North America and two from Asia; formerly included in *Glyceria* and *Puccinellia* (Church 1952).

Torreyochloa pallida (Torr.) G. L. Church (pale) Weak mannagrass. **CULMS** 25–120 cm or more long. **LIGULES** 3–9 mm long. **BLADES** flat and broad, 4–10 mm or more wide. **PANICLES** loose, 8–25 cm long, the lax branches 2–3 per node and ascending to drooping. **SPIKELETS** 4- to 8-flowered. **GLUMES** ovate, 1–2 mm long, the first only slightly smaller than the second. **LEMMAS** strongly 5- to 7-nerved, 1.5–4 mm long, truncate to acute, purplish-banded. **ANTHERS** 0.5–0.7 mm long. $2n = 14$. Freshwater marshes, ponds, seeps, streams, and bogs, coniferous forests, montane to subalpine. ARIZ: Apa, Nav; COLO: Hin, Min, SJn. 2550–3000 m (8400–9800'). Flowering: Jun–Sep. Western North America, from Alaska to New Mexico. Our material belongs to **var. *pauciflora*** (J. Presl) J. I. Davis (few-flowered). The other varieties grow east of the Mississippi.

Tridens Roem. & Schult. Tridens

(Latin *tres*, three, + *dens*, tooth, referring to the tip of the lemma) Tufted perennials, often with knotty bases and short rhizomes, with pithy culms. **LEAVES** with open sheaths, hairy ligules (a long-fringed minute rim), flat to rolled blades, and lacking auricles. **INFL** an open or contracted panicle, few- to many-flowered. **SPIKELETS** several-flowered, awnless, disarticulating above the glumes and between the florets; glumes shorter than to equaling the lowermost floret, 1- to 3-nerved; lemmas 3-nerved, the nerves usually hairy, the apex emarginate to bilobed and with a tiny mucro; palea slightly shorter than the lemma. **STAMENS** 3, reddish purple. $x = 10$. A genus of 14 species native to North America; *Dasyochloa* and *Erioneuron* have been segregated from *Tridens* (Tateoka 1961).

Tridens muticus (Torr.) Nash (awnless) Slim tridens. Tufted perennials with hard bases. **CULMS** 20–50 cm tall (ours). **LIGULES** 0.5–1 mm long. **BLADES** 1–2 mm wide. **PANICLES** narrow and contracted, but interrupted and not spikelike, 6–20 cm long, less than 1 cm wide. **SPIKELETS** 5- to 11-flowered, purplish. **GLUMES** glabrous, the first 3–8 mm long, the second 4–10 mm long and 1-nerved (ours). **LEMMAS** 3.5–7 mm long, short-pilose on the nerves. **PALEAS** 1–2 mm shorter than the lemmas. **ANTHERS** 1–1.5 mm long. $2n = 40$. Desert scrub communities. UTAH. 1300–1550 m (4300–5100'). Flowering: May–Sep. Arid southwestern United States and adjacent Mexico.

Trisetum Pers. Trisetum

(Latin *tres*, three, + *seta*, bristle, alluding to the awn and two lateral teeth at the lemma apex) Tufted annuals and perennials with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat to rolled blades, and lacking auricles. **INFL** a terminal panicle, usually contracted. **SPIKELETS** 2- to 4-flowered, perfect, the rachilla usually prolonged beyond the uppermost floret; disarticulation above the glumes and between the florets (ours), or below the glumes in some; glumes awnless, usually as long as the lowermost floret or longer; lemmas 3- to 7-nerved, awnless or awned

from below the bifid apex; palea 2-nerved, the nerves extended as bristles. **STAMENS** 3. $x = 7$. Seventy-five species occurring in the cool-temperate to Arctic regions of the world (Finot et al. 2005; Hultén 1959).

1. Lemmas awnless or more commonly with short awns less than 2 mm long, scarcely visible ..... ***T. wolfii***
1' Lemmas with awns longer than 3 mm, easily visible ..... (2)

2. Panicles dense and spikelike, the branches mostly less than 1 cm long and erect-appressed; stems 5–50 cm tall; leaves mostly basal ..... ***T. spicatum***
2' Panicles loose and more or less open, the branches mostly 2–6 cm long and spreading; stems usually (30) 40–80 cm tall; leaves mostly cauline ..... ***T. montanum***

Trisetum montanum Vasey (of the mountains) Rocky Mountain trisetum. Loosely tufted, slender perennials. **CULMS** 30–80 cm tall, erect to ascending or even almost sprawling. **LIGULES** 1–4 mm long, erose-ciliate. **BLADES** flat, lax, 1.5–5 mm wide. **PANICLES** loose and open, 8–18 cm long, often drooping, the branches mostly erect-ascending and 2–6 cm long. **SPIKELETS** 2-flowered, usually greenish. **GLUMES** lanceolate, glabrous except for the scabrous keel, the first 3–5.5 mm long and 1-nerved, the second 4–6 mm long and 3-nerved. **LEMMAS** 4.5–5.5 mm long, 5-nerved, the lateral nerves prolonged into teeth, bifid at the apex with narrow teeth; awn 4–6 mm long, geniculate, arising below the apex of the lemma. **PALEAS** slightly shorter than the lemmas. **ANTHERS** 0.8–1.2 mm long. $2n$ = unknown. [*Trisetum spicatum* (L.) K. Richt. subsp. *montanum* (Vasey) W. A. Weber]. Mountain woodlands and forests, clearings, grassy slopes, often in shady understory, mostly at lower elevations than *T. spicatum*. ARIZ: Apa; COLO: Hin, LPl, Min, Mon, SJn; NMEX: RAr. 2270–2700 m (7450–8850'). Flowering: Jul–Sep. Mountains of the southwestern United States. Some authors have merged this within *T. spicatum*, but the most recent treatment of the group (Finot et al. 2005) maintains its distinction at the specific level. Our populations are easily identified and not confused with *T. spicatum*.

Trisetum spicatum (L.) K. Richt. (spikelike) Spike trisetum. Tightly tufted perennials, variously pubescent to glabrous. **CULMS** erect, 5–50 cm tall (our populations). **LIGULES** 1–3 mm long, erose-ciliate. **BLADES** flat to folded, 1–4 mm wide. **PANICLES** dense and spikelike, 2–14 cm long, the branches erect-appressed and less than 1 cm long. **SPIKELETS** 2- to 3-flowered, often purplish. **GLUMES** lanceolate, the first 3–5 mm long and 1-nerved, the second 4.5–6 mm long and 3-nerved and about as long as the upper floret. **LEMMAS** 4–5.5 mm long, 5-nerved, the lateral nerves prolonged into teeth, bifid at the apex with narrow teeth; awn 4–6 mm long, geniculate, arising below the apex of the lemma. **PALEAS** slightly shorter than the lemmas. **ANTHERS** 0.7–1.7 mm long. $2n = 14, 28, 42$. Subalpine to alpine ridges, slopes, and forest clearings. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; UTAH. 2900–3650 m (9500–12000'). Flowering: Jul–Sep. Eastern and western Canada, south through the Rocky Mountains to New Mexico; Asia, Central and South America, Europe, Australia, and New Zealand. Throughout its distribution, *T. spicatum* exhibits enormous variability, and numerous infraspecific taxa have been proposed, for which there exists current disagreement as to their validity.

Trisetum wolfii Vasey (for John Wolf, 1820–1897, Illinois botanist and naturalist) Wolf's trisetum. Tufted perennials, with short rhizomes. **CULMS** stout, erect, 50–100 cm tall. **LIGULES** 1.5–2 mm long, erose. **BLADES** flat, lax, 3–7 mm wide, the lower blades pilose on the outer surface. **PANICLES** contracted, erect, 8–15 cm long, 1–2 cm wide, purplish tinged. **SPIKELETS** 2- to 3-flowered. **GLUMES** nearly as long as the spikelet, the first 4–6 mm long and 1-nerved, the second 5–6.5 mm long and 3-nerved. **LEMMAS** 5–5.5 mm long, 5-nerved, the lateral nerves not prolonged into teeth, the apex acute, awnless or with a short mucro to 2 mm long borne below the apex. **PALEAS** shorter than the lemmas. **ANTHERS** 0.7–0.8 mm long. $2n$ = unknown. [*Graphephorum wolfii* (Vasey) Vasey ex Coult.]. Marshy ground around seeps and springs at high elevations. COLO: LPl, Min, RGr, SJn. 2650–4000 m (8800–13000'). Flowering: Jul–Sep. Endemic to the western United States. Recent authors have segregated this into the small genus *Graphephorum*, with an entire lemma apex and the dorsal awn reduced to a subapical mucro. This may have some merit, but we maintain the traditional alliance out of practicality.

Triticum L. Wheat

(classical Latin name for wheat, derived from *tero*, to grind) Tufted annuals or biennials with hollow culms. **LEAVES** with open sheaths, membranous ligules, flat blades, and well-developed auricles. **INFL** a terminal spike, the rachis persistent or disarticulating. **SPIKELETS** sessile and placed flatwise on the rachis, 2- to 5-flowered, slightly laterally flattened but thick, disarticulation above the glumes and between the florets; glumes thick and firm, 3- to several-nerved; lemmas 5- to 7-nerved, the nerves not converging at the apex, keeled asymmetrically, awned or awnless; palea shorter than the lemma. **STAMENS** 3. $x = 7$. A small genus of 15–20 species native to the cool-temperate regions of Eurasia.

Triticum aestivum L. (of the summer) Wheat. Tufted annuals. **CULMS** erect, 30–150 cm or more tall. **LIGULES** 0.5–1.5 mm long. **BLADES** flat, 2–10 mm or more wide, the auricles prominent. **SPIKES** 5–12 cm long, the rachis continuous. **SPIKELETS** 3- to 5-flowered. **GLUMES** subequal, hardened, asymmetrical, broad, 5- to 7-nerved but the lateral nerves often faint, awn-tipped to 4 mm. **LEMMAS** 7–12 mm long, similar to the glumes, hardened but with scarious margins, essentially awnless to long-awned to 70 mm long. **ANTHERS** 2–3 mm long. $2n = 42$. Cultivated crop throughout the region, sometimes escaping along fields and roadsides but not persisting for long. ARIZ: Nav; COLO: LPl, Mon, SMg; NMEX: McK, RAr, SJn; UTAH. 1400–2200 m (4600–7200′). Flowering: Apr–Jul. Native to Eurasia. Both awned (bearded) and awnless (beardless) forms exist in cultivation.

Urochloa P. Beauv. Signalgrass

(Greek *oura*, tail, + *chloa*, grass, in reference to the tail-like bristle terminating the upper lemma of *U. panicoides*) Tufted annuals and perennials, sometimes mat-forming, with pithy culms. **LEAVES** with open sheaths, membranous-ciliate ligules (the basal membrane minute), flat blades, and lacking auricles. **INFL** terminal and axillary, a panicle of spikelike or rebranching branches. **SPIKELETS** 2-flowered, dorsally compressed, awnless, the lower floret reduced, the upper floret perfect; glumes unequal, the first much smaller than the second; lower floret staminate or sterile, the lemma membranous and similar in size and texture to the second glume; upper floret perfect, the lemma cross-wrinkled or bumpy, the apex round to mucronate to awned, the lemma and palea forming a hard seedcase around the flower and grain. **STAMENS** 3. $x = 7, 8, 9, 10$. About 100 species of tropical to subtropical or warm-temperate regions of the world. Many of the species were formerly included in *Brachiaria* or *Panicum*.

Urochloa arizonica (Scribn. & Merr.) Morrone & Zuloaga (of Arizona) Arizona signalgrass. Tufted annuals. **CULMS** 15–60 cm tall, often branched below. **LIGULES** 1–1.6 mm long. **BLADES** flat, 3–10 mm wide, glabrous. **PANICLES** ovoid, 6–20 cm long, 2–5 cm wide, spikelets and branchlets mostly appressed along the primary branches. **SPIKELETS** 3–4 mm long. **FIRST GLUME** 1.5–2 mm long and 1/2 or less the length of the spikelet. **SECOND GLUME** 2.5–3.2 mm long and as long as the spikelet, usually not cross-veined. **LOWER FLORET** staminate or sterile, 2.5–3.2 mm long, the palea present. **UPPER FLORET** 2.8–3 mm long. $2n = 36$. [*Brachiaria arizonica* (Scribn. & Merr.) S. T. Blake; *Panicum arizonicum* Scribn. & Merr.]. Disturbed ground and rocky slopes in desert communities. ARIZ: Apa. 1550–1650 m (5200–5400′). Flowering: Aug–Sep. Southwestern United States and northern Mexico, introduced in the southeastern United States.

Vahlodea Fr. Mountain Hair-grass

(for Jens Laurentius Moestue Vahl, 1796–1854, the son of botanist Martin Vahl) A monotypic genus, discontinuously circumboreal, also South America.

Vahlodea atropurpurea (Wahlenb.) Fr. ex Hartm. (dark purple) Mountain hair-grass. Loosely tufted perennials with open sheaths. **CULMS** hollow, 15–80 cm tall. **LIGULES** membranous, 1–4 mm long, often lacerate. **BLADES** flat, 2–8 mm wide, those of the culm often conspicuously erect. **PANICLES** open to contracted, 5–20 cm long, the branches capillary and naked below. **SPIKELETS** 2-flowered, the rachilla prolonged beyond the upper floret, but this hidden among the callus hairs and easily missed; disarticulation above the glumes and between the florets. **GLUMES** exceeding the florets, 4–6 mm long, acuminate, dull purplish (rarely pale), the first 4–6 mm long and 1-nerved, the second about the same length and 3-nerved. **LEMMAS** included within the glumes, 5-nerved, 1.8–3 mm long, with callus hairs about 1/2 the length of the floret; awn arising at about midlength, 2–4 mm long, exserted to scarcely visible. **PALEAS** slightly shorter than the lemmas. **STAMENS** 3, the anthers 0.5–1.2 mm long. $x = 7$; $2n = 14$. [*Deschampsia atropurpurea* (Wahlenb.) Scheele]. Woods and wet meadows, subalpine to alpine habitats. COLO: Min, SJn. 3000–4100 m (9800–13500′). Flowering: Aug–Sep. Easily confused with large-flowered *Deschampsia cespitosa* until one recognizes the large, dull glumes enclosing the florets and the awn attached at midlength. The erect culm blades are also quite distinctive, but this feature may not be consistent.

Vulpia C. C. Gmel. Six-weeks Fescue

(for J. S. Vulpius, 1760–1840, a pharmacist-botanist of Baden, Germany) Tufted annuals (rarely long-lived) with hollow culms. **LEAVES** with open sheaths, membranous-ciliate ligules, flat to rolled blades, and lacking auricles. **INFL** a terminal or axillary panicle, sometimes weakly developed and racemose. **SPIKELETS** 3- to 17-flowered, on short pedicels, laterally compressed, the terminal florets reduced; disarticulation above the glumes and below the florets; glumes shorter than the florets, the first 1-nerved, the second 3-nerved; lemmas 3- to 5-nerved, awned or awnless; palea slightly shorter than the lemma. **STAMENS** 1 (rarely 3 in cleistogamous spikelets). $x = 7$. About 30 species, many native to Europe and the Mediterranean region. Formerly included in *Festuca*.

1. First glume less than 1/2 the length of the second glume, often nearly absent ..... ***V. myuros***
1' First glume more than 1/2 the length of the second glume ..... ***V. octoflora***

Vulpia myuros (L.) C. C. Gmel. (mouse-tail) Rat-tail fescue. Loosely tufted annuals. **CULMS** 10–65 cm tall. **LIGULES** 0.3–0.5 mm long. **BLADES** usually rolled, 0.4–2 mm wide. **PANICLES** 3–20 cm long, narrow and contracted, less than 2 cm wide, with a single branch per node. **SPIKELETS** 3- to 7-flowered, the rachilla internodes 0.7–2 mm long. **GLUMES** unequal, the first 0.5–2 mm long and less than 1/2 the length of the second. **LEMMAS** 5-nerved, 4.5–7 mm long; awns 5–15 mm long. **ANTHERS** 0.5–2 mm long. $2n = 14, 42$. [*Festuca myuros* L.]. Dry, disturbed ground in the desert. ARIZ: Apa. 1500–1600 m (4900–5300'). Flowering: Apr–Jul. Native to Europe and North Africa, throughout western North America.

Vulpia octoflora (Walter) Rydb. (eight-flowered) Six-weeks fescue. Loosely tufted annuals. **CULMS** 5–50 cm tall. **LIGULES** 0.3–1 mm long. **BLADES** flat to rolled, 0.5–1 mm wide. **PANICLES** 1–10 (15) cm long, narrow and contracted, less than 2 cm wide, with 1–2 branches per node. **SPIKELETS** 5- to 15-flowered, the rachilla internodes 0.5–0.7 mm long. **GLUMES** unequal, the first 1.7–4.5 mm long, 1/3 to 1/2 the length of the second. **LEMMAS** 5-nerved, 2.7–6.5 mm long; awns 0.3–9 mm long. **ANTHERS** 0.3–1.5 mm long. $2n = 14$. [*Festuca octoflora* Walter]. Grassland and desert plains, open woodlands, rocky slopes, disturbed roadsides. 1450–2100 m (4800–7000'). Flowering: Jul–Sep. Nearly throughout North America. We have three weakly defined varieties, not satisfactorily distinguished:

1. Spikelets typically 4–6.5 mm long; awn of the lowermost lemma 0.3–3 mm long ..... **var. *glauca***
1' Spikelets typically 5.5–13 mm long; awn of the lowermost lemma 2.5–9 mm long ..... (2)

2. Lemmas scabrous to pubescent ..... **var. *hirtella***
2' Lemmas glabrous or slightly scabrous, often scabrous on the margins ..... **var. *octoflora***

var. *glauca* (Nutt.) Fernald (bluish green) [*Festuca tenella* Willd.; *F. octoflora* Walter var. *glauca* (Nutt.) Fernald]. NMEX: McK, RAr; UTAH.

var. *hirtella* (Piper) Henrard (a little hairy) [*Festuca octoflora* Walter subsp. *hirtella* Piper]. ARIZ: Apa.

var. *octoflora* ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH.

POLEMONIACEAE Juss. PHLOX FAMILY

J. Mark Porter

Annuals, perennial herbs, or shrubs, pubescent, rarely glabrous. **LEAVES** alternate to opposite, simple to compound; stipules absent. **INFL** cymose, open to congested, the cymes usually arranged in panicles; flowers rarely solitary. **FLOWERS** perfect, actinomorphic to zygomorphic, hypogynous; sepals usually 5, united, with equal to unequal lobes, the tube usually with herbaceous ribs separated by hyaline membranes that are distended or ruptured in fruit; corolla tubular, with 5 lobes; stamens usually 5, epipetalous, alternate with the corolla lobes, equally to unequally inserted; filaments equal to unequal in length; ovary usually with 3 locules; style simple, included to exserted, with (2) 3 stigmatic lobes. **FRUIT** a capsule, rarely indehiscent or circumscissile, with 1–many ovules and seeds in each locule, the mature seeds in most taxa becoming gelatinous when wet, rarely largely unchanged when wet. Approximately 26 genera, about 380 species, chiefly of western North America, but also in South America and temperate Eurasia (Grant 1959; Porter and Johnson 2000).

1. Calyx tube apparently herbaceous throughout, becoming membranous and not ruptured in fruit ..... (2)
1' Calyx tube with herbaceous ribs (costae) separated by thin, translucent intercostal membranes, these usually distended or ruptured in fruit ..... (3)

2. Annual; leaves entire to toothed ..... ***Collomia***
2' Perennial; leaves pinnately compound ..... ***Polemonium***

3. Cauline leaves mostly opposite, upper ones sometimes alternate, either simple or palmately lobed to compound ..... (4)
3' Cauline leaves mostly alternate, simple to pinnately lobed or compound ..... (7)

4. Stamens inserted at different levels on the tube; corolla salverform; leaves simple, linear to linear-oblong or narrowly lanceolate ..... (5)
4' Stamens inserted at the same level on the tube; corolla rotate, campanulate, or funnelform, if salverform then the leaves somewhat rigid and spinulose; leaves simple and filiform to palmately compound, the blades or lobes filiform to linear ..... (6)

5. Annual; corolla tube 4–8 mm long ..... ***Microsteris***
5' Perennial; corolla tube (5) 10–30 mm long ..... ***Phlox***

6. Hyaline membranes separating the calyx lobes narrow and somewhat obscure; uppermost leaves opposite; corolla diurnal, and often open at night, corolla tube glandular-pilose externally ..... ***Leptosiphon***
6' Hyaline membranes separating the calyx lobes prominent; uppermost leaves often alternate; corolla nocturnal, closed during the day, corolla tube glabrous externally ..... ***Linanthus***

7. Leaves deeply palmately or subpalmately lobed, the lobes rigid ..... (8)
7' Leaves entire or pinnately lobed to toothed, the lobes usually soft and herbaceous (rigid in *Navarretia*) ..... (9)

8. Corolla white to cream-colored or yellowish, opening nocturnally, usually closed during the day ..... ***Linanthus***
8' Corolla bright blue, with yellow anthers, opening from noon to sundown, closed during the night ..... ***Giliastrum***

9. Inflorescence capitate to densely corymbose, terminal at tips of ascending to erect branches; flowers subsessile to sessile ..... (10)
9' Inflorescence open and diffuse, with 2–5 flowers at the branch tips, or composed of several compact to dense, lateral clusters; flowers short- to long-pedicellate ..... (13)

10. Calyx lobes unequal; floral bracts pinnately lobed, the apices firm or rigid ..... (11)
10' Calyx lobes equal; floral bracts usually entire to toothed, the apices acute to short-aristate but not sharply rigid ..... (12)

11. Upper leaves and floral bracts woolly or with entangled hairs; anthers sagittate ..... ***Eriastrum***
11' Upper leaves and floral bracts glabrous or short glandular-pubescent; anthers elliptic ..... ***Navarretia***

12. Corolla campanulate to funnelform, blue or with white to bluish lobes and a yellow tube or throat ..... ***Gilia***
12' Corolla salverform, uniformly white to lavender ..... ***Ipomopsis***

13. Corolla salverform, uniformly white to bluish or red; flowers congested at tips of lateral branches ..... ***Ipomopsis***
13' Corolla funnelform to salverform, if salverform then usually with white to bluish lobes and a yellow tube or throat (crimson in *Aliciella subnuda*); flowers 2–5 (7) in loose, terminal clusters ..... (14)

14. Corolla broadly funnelform, rotate, lobes deep blue, anthers bright yellow; leaves gradually reduced upward, pinnatifid below, subpalmate above, the lobes needlelike ..... ***Giliastrum***
14' Corolla narrowly funnelform to salverform, the lobes white to red or bluish, the throat or tube often yellow, anthers white to blue; leaves abruptly reduced above a basal rosette (except *Aliciella latifolia*), the lobes usually acute or mucronate ..... (15)

15. Glandular hairs on calyx, pedicels, and upper leaves colorless to yellowish; basal and lower leaves glabrous or mostly glandular; seeds not conspicuously gelatinous when wet ..... ***Aliciella***
15' Glandular hairs on calyx, pedicels, and leaves, if present, dark or reddish; basal and lower leaves with short, curled hairs or cobwebby hairs; seeds gelatinous when wet ..... ***Gilia***

Aliciella Brand. Aliciella

(honoring Alice Eastwood, botanist, 1859–1953) Annual or perennial herbs, simple to branched, leafy to scapose, mostly glandular, the hairs uniseriate with terminal, multicellular glands, the glands colorless. **LEAVES** basal to alternate, entire to deeply pinnately lobed, the lobes completely confluent with the rachis, flat to terete. **INFL** a terminal panicle, open to congested, the basic unit composed of 2–7 pedicelled flowers subtended by a single bract. **FLOWERS** actinomorphic; calyx tube membranes usually ruptured in fruit, rarely remaining intact; corolla funnelform to salverform, the tube, throat, and lobes similar in color or with different hues; stamens equally or rarely unequally inserted on the corolla tube or throat; filaments equal or unequal in length; anthers included to exserted; style included to exserted. **FRUIT** a capsule, ovoid to spheroid; seeds 2–many per locule, unchanged or only weakly gelatinous when wet. (Porter 1998.) Twenty-two species restricted to western North America. Formerly included in *Gilia*; however, *Aliciella* has been shown to be more closely related to *Ipomopsis* and *Loeselia* than to *Gilia*.

1. Stamens more or less unequally inserted in the upper tube; flowers subsessile to short-pedicelled, in terminal, corymbose or subcapitate clusters; corolla watermelon-red to crimson ..... ***A. subnuda***
1' Stamens equally inserted at the sinuses or midtube (*A. latifolia*); most flowers pedicelled, the clusters spreading to ascending in open inflorescences; corolla white, bluish, lavender, or magenta ..... (2)

2. Leaves oblanceolate to broadly ovate, dentate, the teeth broad, acuminate-aristate; filaments unequal in length and papillose below the anthers ..... ***A. latifolia***
2' Leaves linear to oblanceolate, pinnately lobed, the teeth acute to at most mucronate; filaments smooth below the anthers ..... (3)

3. Corolla lobes 3-toothed, the central one longest; corolla somewhat salverform, narrower at the orifice than at midtube ..... ***A. triodon***
3' Corolla lobes obtuse to acuminate; corolla somewhat funnelform, orifice broader than midtube ..... (4)

4. Anthers long-exserted from the corolla tube, nearly as long as the corolla lobes ..... (5)
4' Anthers not or only shortly exserted from the corolla tube, less than 1/2 as long as the corolla lobes ..... (6)

5. Leaves all simple, entire and terete; calyx usually suffused with blue, corolla tube 1.4–4.3 mm long ..... ***A. sedifolia***
5' Leaves pinnatifid, the lobes much longer than the width of the rachis; calyx sometimes suffused with purple, but not blue; corolla tube 4–9 mm long ..... ***A. pinnatifida***

6. Basal and lower leaves usually twice pinnately lobed; corolla tube conspicuously glandular externally on the lower tube ..... ***A. hutchinsifolia***
6' Basal and lower leaves entire, dentate or once pinnately lobed; corolla tube glabrous externally, sometimes with a few glandular hairs near the orifice, external to the insertion of the stamens ..... (7)

7. Corolla tube 3–6 mm long, the lobes 1–3 mm long; annual; corolla lobes obtuse to nearly truncate, with a cuspidate apex ..... ***A. leptomeria***
7' Corolla tube 8–15 mm long, lobes 3.5–6 mm long; short-lived perennials, with 1–3 rosettes ..... (8)

8. Leaves linear, entire ..... ***A. formosa***
8' Leaves spatulate to narrowly oblong, dentate or once pinnately lobed ..... (9)

9. Corolla blue when fresh, drying pale blue; corolla lobes narrowly oblanceolate, 1.9–3.5 mm wide ..... ***A. cliffordii***
9' Corolla magenta when fresh, drying blue or magenta; corolla lobes oblanceolate, 2–4.2 mm wide ..... ***A. haydenii***

Aliciella cliffordii J. M. Porter (honoring Arnold Clifford, botanist) Clifford's Diné-star. Short-lived perennial, 12–50 cm tall, usually branched throughout; stems glabrous to glandular-pubescent. **LEAVES** forming a rosette, gradually to abruptly reduced above the rosette; basal and lower sparsely short-pubescent above, glabrous beneath, lobed to toothed, the rachis broader than the lobes; cauline usually glabrous, toothed to entire. **INFL** open, with 1–5 pedicelled flowers on tips of spreading to ascending branches. **FLOWER** calyx 4–5 mm long, glandular-pubescent to nearly glabrous in Arizona, the lobes acute; corolla narrowly funnelform, 6–10 mm long, blue, sometimes pale; stamens inserted at the sinuses of the corolla lobes; anthers located at the orifice or slightly exserted; stigma located above to below the anthers. **FRUIT** a capsule 3–5 mm long, ovoid. Sandy clay soils, badlands, piñon-juniper and ponderosa pine communities. ARIZ: Apa; NMEX: McK, SJn. 1525–1980 m (5000–6500'). Flowering: May–Jun. Fruit: May–Jul. Endemic to the eastern slopes of the Chuska Mountains. Formerly but incorrectly identified as *Gilia haydenii*. Pollinated primarily by bee flies.

Aliciella formosa (Greene ex Brand) J. M. Porter (beautiful) Beautiful gilia. Long-lived perennial, 5–15 cm tall, from branched, woody caudex, sparsely and coarsely glandular. **LEAVES** forming a rosette, entire, linear, 1–4.5 cm long, 1–1.5 mm wide, glandular and crisp-puberulent with white hairs; cauline leaves linear, entire, gradually to abruptly reduced in size. **INFL** few-flowered, open, cymose panicle, the flowers mostly crowded at the tips of the branches. **FLOWER** calyx 3.5–6.1 mm long, tube slightly longer than the lobes, glandular; corolla narrowly funnelform-salverform, 14.7–27 mm long, rose-purple, magenta, or pink-lavender, rarely white, but drying to a lead-blue, stamens inserted at the sinuses of the lobes, anthers slightly exserted, corolla sparsely glandular externally, at filament insertion. **FRUIT** a capsule 3.5–7 mm long, ovoid. [*Gilia formosa* Greene ex Brand]. Sandy clay soils, badlands, piñon-juniper woodland and desert scrub communities. NMEX: SJn. 1640–1980 m (5000–6500'). Flowering: May–Jun. Fruit: late May–Jul. Endemic to the Four Corners region. Pollinated primarily by hawkmoths.

Aliciella haydenii (A. Gray) J. M. Porter (honoring Ferdinand Hayden, geologist and explorer) Hayden's gilia. Short-lived perennial, 12–50 cm tall, usually branched throughout. **STEMS** glabrous to glandular-pubescent. **LEAVES** forming a rosette, gradually to abruptly reduced above basal rosette; basal and lower sparsely short-pubescent above, glabrous beneath, lobed to toothed, the rachis broader than the lobes; cauline usually glabrous, toothed to entire. **INFL** open, with 1–5 pedicelled flowers on tips of spreading to ascending branches. **FLOWER** calyx 4–5 mm long, glandular-pubescent to nearly glabrous in Arizona, the lobes acute; corolla funnelform, 6–10 mm long, magenta; stamens inserted at the sinuses of the corolla lobes; anthers located at the orifice or slightly exserted; stigma located above to below the anthers. **FRUIT** a capsule 3–5 mm long, ovoid. $2n = 16, 18$. [*Gilia haydenii* A. Gray]. Two subspecies. Southeastern Utah to south-central Colorado, south to northeastern Arizona and north-central to northwestern New Mexico.

1. Corolla 17–26 mm, the lobes 6–9 mm long, corolla tube glandular externally; corolla drying pink; plants primarily of higher-elevation piñon-juniper, oak woodlands, and ponderosa pine communities ..... **subsp. *crandallii***
1′ Corolla 11–20 mm, the lobes 3.5–5.5 mm long, corolla tube glabrous or only a few glands externally at the point where the filaments are attached; corolla drying dull blue; plants primarily of lower-elevation piñon-juniper, saltbush, and desert scrub communities ..... **subsp. *haydenii***

subsp. *crandallii* (Rydb.) J. M. Porter (for Cletus Crandall, forester) Crandall's gilia. Corolla (16) 17–26 mm long, rose-purple to magenta, corolla tube uniformly glandular externally. Rocky clay soils, clay badlands, piñon-juniper and ponderosa pine woodland communities. COLO: LPl, Mon; NMEX: RAr, SJn. 1700–2260 m (5600–7500′). Flowering: May–Jun. Fruit: late May–early Jul. Southwestern and south-central Colorado, and northwestern and north-central New Mexico.

subsp. *haydenii* Corolla 10–20 mm long, magenta, with a few glands externally at the point of filament attachment. Rocky clay soils, clay badlands, saltbush scrub, and piñon-juniper woodland communities. ARIZ: Apa; COLO: LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1220–1980 m (4000–6500′). Flowering: May–Jun. Fruit: late May–early Jul. Southeastern Utah to south-central Colorado, south to northeastern Arizona and northwestern New Mexico.

Aliciella hutchinsifolia (Rydb.) J. M. Porter (*Hutchinsia*, genus of Brassicaceae; *folius*, leaves) Broadlobe gilia, Hutchinsia-leaved gilia. Annual, 5–30 cm tall, usually branched throughout. **STEMS** glandular. **LEAVES** glandular and short-pilose, reduced above the basal rosette; basal and lower lobed once or twice, the lobes entire to toothed; cauline basally lobed to entire. **INFL** open, with 1–2 pedicelled flowers at branch tips. **FLOWER** calyx 2–3 mm long, glandular-pubescent, the lobes acuminate to attenuate; corolla narrowly funnelform to salverform, 7–15 mm long, the tube and lobes white to lavender, the throat yellow; stamens inserted on upper throat; anthers located slightly above the throat; stigma located slightly below or among the anthers. **FRUIT** a capsule 3–6 mm long, ovoid. $2n = 18$. [*Gilia hutchinsifolia* Rydb.]. Washes, bajadas, desert shrublands, and woodlands. ARIZ: Apa, Nav; UTAH. 1150–1700 m (3800–5600′). Flowering: Apr–Jun. Fruit: May–Jun. Southern California, Nevada to southern Utah, south to Arizona.

Aliciella latifolia (S. Watson) J. M. Porter (broad leaf) Broadleaf gilia. Annual, (4) 8–30 cm tall, simple to branched throughout. **STEMS** glandular. **LEAVES** glandular and pilose, gradually reduced upward, simple, oblanceolate to rotund, dentate to shallowly lobed, the teeth or lobes acuminate. **INFL** open, with 1–2 pedicelled to subsessile flowers at branch tips or in axils. **FLOWER** calyx 2.8–4.8 mm long, sparsely to moderately glandular-pubescent, the lobes equal to or longer than the tube, spinulose; corolla funnelform, bright pink to pink-purple, the tube and throat 6–11 mm long, the lobes 3–8 mm long; stamens inserted on the lower throat; anthers located in the upper throat; stigmas slightly exceeding the stamens. **FRUIT** a capsule 3–4.5 mm long, ovoid to oblong. $2n = 36$. [*Gilia latifolia* S. Watson]. Our material is **subsp. *imperialis*** (S. L. Welsh) J. M. Porter (Imperial Valley). Cataract gilia. Calyx 2.8–4.8 mm long vs. 4–6 mm in subsp. *latifolia*; fruits 3–4.5 mm long vs. 4–7 mm in subsp. *latifolia*; plants frequently over 25 cm tall. Sandy washes, restricted to the Colorado River drainage, UTAH. 1160–1590 m (3800–5200′). Flowering: Mar–May. The species as a whole ranges from southern California to southern Utah, and south to northwestern Mexico.

Aliciella leptomeria (A. Gray) J. M. Porter (thin parts) Common gilia, lobeleaf gilia, Great Basin gilia. Annual, 6–30 cm tall, simple to branched. **STEMS** usually glandular. **LEAVES** glandular, rarely glabrous, abruptly reduced above the basal rosette; basal and lower dentate to shallowly lobed, the teeth or lobe length equal to the rachis width; cauline dentate to entire. **INFL** open, with 1–3 pedicelled flowers at branch tips, the terminal pedicel subsessile or often shorter than those below. **FLOWER** calyx 1–3 mm long, usually glabrous, the lobes obtuse to cuspidate; corolla salverform to narrowly campanulate, 3–7 mm long, the tube equal to or slightly longer than the calyx, the lobes acuminate;

the tube and lobes white, pink, or lavender, the throat yellow; stamens inserted on the upper throat; anthers slightly exserted; stigmas slightly exceeding the anthers. **FRUIT** a capsule 3–5 mm long, narrowly ovoid. $2n = 34, 36$. [*Gilia leptomeria* A. Gray]. Washes, rocky slopes, blackbrush, desert scrub, sagebrush, mountain brush, piñon-juniper, and ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: McK, SJn; UTAH. 1150–2300 m (3800–7500'). Flowering: Apr–Jun. Washington, Idaho, and Wyoming, south to California, Arizona, and New Mexico. Populations in the study area differ significantly (though cryptically) from populations near the type locality (the Great Salt Lake, Utah). It is likely that our material represents a different but unnamed taxon. Used as a poultice and applied to scorpion stings or worm bites by the Kayenta Navajo.

Aliciella pinnatifida (Nutt. ex A. Gray) J. M. Porter (*pinnate*, divided leaf, + *fidus*, divided in the distal third) Pinnate gilia. Biennial or short-lived perennial (annual), 15–70 cm tall, densely glandular or largely glabrous, with only a few scattered glands. **LEAVES** forming a basal rosette, persistent or sometimes deciduous, deeply pinnatifid with narrow to sometimes elliptic lobes, coarsely few-toothed or entire, 1.5–8 cm long, 7–30 mm wide; cauline leaves deeply pinnatifid, often as large as basal, progressively reduced above, often undivided, ultimately linear bracts. **INFL** loose and open, but the ultimate pedicels short, (0) 1–5 mm long, often sympodial. **FLOWER** calyx 2.5–4.5 mm long, the lobes slightly shorter than the tube; corolla tube pale, short and broad, 4–9 mm long, lobes blue, loosely to widely spreading, 3–5 mm long, from slightly longer to barely more than 1/2 as long as tube; anthers well-exserted from the tube; style exserted, equal to or longer than anthers. **FRUIT** a capsule 2.5–4 mm long, narrowly ovoid. $2n = 16$. [*Gilia pinnatifida* Nutt. ex A. Gray]. Dry, open places, sagebrush, piñon-juniper, mixed conifer, and subalpine meadow communities. COLO: Arc, Hin, Min, RGr, SJn; NMEX: RAr. 1550–2900 m (5100–9500'). Flowering: May–Sep. Fruit: Jun–Sep. Colorado and southern Wyoming, to western Nebraska and northern New Mexico.

Aliciella sedifolia (Brandegee) J. M. Porter (*Sedum*-like leaves) Sedum-leaved aliciella. Monocarpic, short-lived perennial, 4–12 cm tall. **STEMS** glandular-pubescent, simple and erect, becoming more or less thyrsoid in flower. **LEAVES** forming a rosette, linear, entire, 0.6–1.7 cm long, 1–2.6 mm wide, terete and succulent, cauline leaves gradually reduced in size, becoming bractlike. **INFL** strict, thyrsoid, cymose panicle. **FLOWER** calyx 2.4–4.5 mm long, bearing dense glandular trichomes, the lobes shorter than the tube; corolla 4–8.5 mm long, mostly blue to lavender, glabrous externally, salverform to narrowly campanulate; the tube pale, shorter than the calyx, 1.4–4.3 mm long, lobes oval to orbicular, 2.3–4.6 mm long, 1.4–2 mm wide; stamens affixed in the sinus of the corolla lobes, the free portion as long as the fused portion, 1.8–4.3 mm long, glabrous, anthers 0.7–1.8 mm long, shortly exserted; nectary an undulate disc at the base of the ovary; ovary ovoid to oblongoid, glabrous, about 1.6 mm long and 1.1 mm wide at the base, the style 3–4.2 mm long, stigmatic lobes approximately 0.5 mm long. **FRUIT** a capsule 3–6.5 mm long. **SEEDS** 1–5 per locule, about 1.5 mm long, lenticular to angular, narrowly winged. Alpine flats covered with tuff or rhyolitic gravel. COLO: Hin. 3650–4120 m (12000–13500'). Flowering: Jul–Aug. Fruit: Aug. Collections are known only from Sheep Mountain and Half Peak. Though not collected in the study area, it is known to occur within 3 km and there is ample unexplored habitat. One of the rarest species in the family.

Aliciella subnuda (Torr. ex A. Gray) J. M. Porter **CP** (somewhat naked) Carmine gilia. Biennial or short-lived perennial, 10–70 cm tall. **STEMS** branching only within the inflorescence, glandular. **LEAVES** forming a basal rosette, glandular, abruptly reduced above the basal rosette; basal oblanceolate, dentate to shallowly lobed distally; cauline narrowly oblong to linear, entire. **INFL** congested, usually corymbose, with short-pedicelled flowers at top of stem. **FLOWER** calyx 4–6 mm long, glandular short-pubescent; corolla salverform, 10–20 (25) mm long, deep scarlet to crimson, the tube 2–3 times the calyx; stamens inserted on the upper tube; anthers included in the tube or slightly exserted; stigma located below to above the anthers. **FRUIT** a capsule 3–5 mm long, narrowly ovoid. $2n = 16$. [*Gilia subnuda* Torr. ex A. Gray]. Sandy soils, sandstone outcrops, desert scrub, piñon-juniper, and ponderosa pine communities. ARIZ: Apa; Coc, Nav; UTAH. 1500–2400 m (5000–7800'). Flowering: Apr–Jun (Aug). Fruit: May–Aug. Northern Arizona to southern Utah (previously reported from Colorado and Nevada in error). The flowers were ground and eaten to ensure a healthy pregnancy and ease labor by the Kayenta Navajo.

Aliciella triodon (Eastw.) Brand (three teeth, referring to corolla lobes) Three-toothed aliciella. Annual, 5–15 (20) mm tall, simple to branched. **STEMS** glandular. **LEAVES** glandular, abruptly reduced above the basal rosette; basal dentate to shallowly lobed, the rachis broader than the teeth or lobes; cauline usually entire, linear. **INFL** open, with 1–3 short-pedicelled flowers on distal branches. **FLOWER** calyx 1–3 mm long, usually glabrous, the lobes acuminate; corolla narrowly funnelform, 3–6 mm long, the tube exserted, white to pink, the throat light yellow, the lobes 3-toothed, white to pink; stamens inserted on the upper throat; anthers slightly exserted; stigma slightly exceeding the

anthers. **FRUIT** a capsule, 3–4 mm long, narrowly ovoid. $2n = 18$. [*Gilia triodon* Eastw.]. Sandy, adobe, or gravelly soils, sagebrush scrubland and piñon-juniper woodland communities. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: SJn; UTAH. 1150–1740 m (3800–5700'). Flowering: May–Jun. Fruit: late May–Jun. Southeastern California, northern Arizona, and northwestern New Mexico to Nevada, Utah, western Colorado, and western Wyoming.

Collomia Nutt. Collomia

(glue, referring to the wetted seeds) Annual or perennial herbs. **LEAVES** mostly alternate, simple to lobed. **INFL** terminal and axillary, compact, subcapitate or rarely solitary, bracteate. **FLOWERS** perfect, actinomorphic, subsessile; calyx herbaceous, becoming membranous, not ruptured in fruit, the membranes distended or carinate in fruit, the ribs and lobes with prominent veins in fruit, acute to acuminate; corolla funnelform to salverform, blue, red, yellow, or white; stamens equally or unequally inserted in the corolla tube; filaments mostly unequal in length; anthers included to exserted; style included to exserted. **FRUIT** a capsule, ovoid to ellipsoid, explosively dehiscent; seeds (in our area) 1 per locule, gelatinous when wet. $2n = 16$ (Wherry 1944; Chuang, Hsieh, and Wilken 1978; Wilken et al. 1982). Subtropical and temperate forests or shrublands, 15 species of North America, one species in South America.

1. Corolla 15–30 mm long, yellow to salmon-orange; pollen blue; calyx lobes acute ..... ***C. grandiflora***
1' Corolla 8–15 mm long, white to bluish violet; pollen cream to blue; calyx lobes acuminate ..... ***C. linearis***

Collomia grandiflora Douglas ex Lindl. (large-flowered) Large-flowered collomia, large collomia. Annual. **STEMS** 1–5 dm. **LEAVES** subsessile, entire to toothed, 1–6 cm long, the lower cauline leaves linear to narrowly elliptic, the upper leaves lanceolate to ovate. **INFL** terminal or axillary, compact, the bracts ovate to lanceolate, 10–22 mm long, 4–10 mm wide, the lower margins short-pubescent. **FLOWER** calyx lobes acute; corollas of normal flowers open, 15–25 (30) mm long, orange to salmon or (in cleistogamous flowers) unopened, restricted to the lower axillary cymes, less than 5 mm long, white to light yellow; pollen blue; style equal to the corolla tube. **FRUIT** an explosively dehiscing capsule 5–6 mm long. Dry streambeds, shaded slopes, pine forest, oak woodland, mountain brush, piñon-juniper woodland, sagebrush, aspen, and spruce-fir communities. COLO: Arc, LPl, Mon. 1400–2570 m (4500–8200'). Flowering: Apr–Jun (Aug). Fruit: May–Sep. British Columbia, Washington to Idaho, south to California and east to Colorado and Arizona.

Collomia linearis Nutt. (narrow, referring to leaves) Linear-leaf collomia, small collomia. Annual. **STEMS** 1–5 dm tall. **LEAVES** subsessile, entire, 1–6 cm long, the lower cauline leaves linear to lanceolate, the upper leaves narrowly lanceolate. **INFL** terminal, rarely axillary, compact, the bracts ovate to lanceolate, 8–20 mm long, 3–6 mm wide, the lower margins glandular. **FLOWER** calyx lobes acuminate; corollas salverform, 8–15 mm long, bluish violet to nearly white; pollen cream to blue; style equal to the corolla tube. **FRUIT** a capsule 3–5 mm long. Open sites, meadows, pine forest, sagebrush, mountain brush, aspen, and spruce-fir communities. COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 2000–2500 m (6500–8000'). Flowering: Jun–Jul, rarely into Sep. Fruit: late Jun–Sep. Western Canada to California and east to Colorado, New Mexico, and Wyoming; introduced to central and eastern U.S.

Eriastrum Wooton & Standl. Star-gilia, Woolly-star, Eriastrum

(wool star) Annual (in our area) or perennial. **STEMS** solitary to much-branched, erect to prostrate, leafy. **LEAVES** basal to alternate, simple to deeply pinnately lobed, the lobes confluent with the rachis, flat to terete, spinulose. **INFL** terminal, compact, bracteate, short-woolly, the outer bracts deeply lobed. **FLOWERS** sessile, actinomorphic to slightly irregular; calyx tube membranes usually ruptured in fruit, the lobes subequal to strongly unequal, acute to attenuate, often spinulose; corolla actinomorphic, funnelform to salverform, or zygomorphic with at least 2 lobes unequal, white to deep bluish lavender; stamens equally to unequally inserted on the throat; anthers usually exserted; filaments equal to subequal in length; style included to exserted. **FRUIT** a capsule, ellipsoid to ovoid; seeds 1–several per locule. $n = 7$ (Mason 1945; Harrison 1972; Patterson 1993). Fourteen to 17 species of the arid western U.S. and northern Mexico.

Eriastrum diffusum (A. Gray) H. Mason (widely spreading) Spreading eriastrum, spreading starflower, miniature woolly-star. Annual, 3–35 cm tall, erect and simple to diffusely branching. **LEAVES** subglabrous to sparsely woolly, entire or with 1–2 pairs of lobes near the base of the rachis, 1–3 cm long. **FLOWER** calyx 6–7 mm long; corolla actinomorphic, narrowly funnelform to slightly zygomorphic, the throat white to yellow, the lobes white to pale blue or bluish lavender, the tube and throat 4–7 mm long, slightly longer than the calyx tube, the lobes 3–5 mm long; stamens inserted on the throat near the sinuses, less than the length of the corolla lobes; filaments slightly unequal in length; pistil 5–7 mm long; style included in the tube or throat. **FRUIT** a capsule, 2–4 mm long. $2n = 14$. Open sites; desert shrublands, blackbrush, and piñon-juniper woodland communities. COLO: Mon, SMg; UTAH. 1220–1710 m (4000–5600'). Flowering: May–Jun. Fruit: late May–Jul. California south to northern Mexico, east to Texas. Our material is

closest to **subsp. *jonesii*** H. Mason, with corollas 10–12 mm long and anthers 0.7–1 mm long. The typical subsp. *diffusum* is of the Chihuahuan Desert and has shorter corollas and anthers less than 0.8 mm long.

Gilia Ruiz & Pav. Gilia

(for Philippo Gili, Italian naturalist) Annual herbs, simple to branched, leafy to scapose, glabrous, pubescent to glandular, the hairs sometimes loosely tangled like cobwebs. **LEAVES** basal to alternate, entire to deeply pinnately lobed, the lobes completely confluent with the rachis, flat to terete. **INFL** terminal, paniculate, open to congested, the basic unit composed of 2–7 pedicelled flowers subtended by a single bract, rarely solitary. **FLOWERS** actinomorphic; calyx tube membranes usually ruptured in fruit, rarely remaining intact; corolla funnelform to salverform, the tube, throat, and lobes often with different hues; stamens equally to subequally inserted on the corolla tube or throat; filaments equal or unequal in length; anthers included to exserted; style included to exserted. **CAPSULES** ovoid to spheroid; seeds 2–many per locule (Day 1993). About 40 species; western North America and southern South America.

1. Flowers subsessile to short-pedicelled, in capitate terminal clusters ..... ***G. capitata***
1' Most flowers pedicelled, spreading to ascending in open inflorescences ..... (2)

2. Stems near base glabrous and glaucous; basal leaves usually glabrous; cauline leaves clasping; rachis of basal leaves strap-shaped ..... ***G. sinuata***
2' Stems near base and basal leaf axils cobwebby-pubescent; cauline leaves not clasping; basal leaf rachis ± linear .. (3)

3. Corolla 4–8 mm long, throat white to pale blue, lobes equal to or longer than the throat; calyx lobes acute ..... ***G. clokeyi***
3' Corolla 7–12 mm long, throat yellow, lobes shorter than the throat; calyx lobes acuminate ..... ***G. ophthalmoides***

Gilia capitata Sims (headlike) Ball gilia, capitate gilia, ornamental gilia. Annual, 10–50 cm tall, branched throughout. **STEMS** glabrous to glandular or sparsely tomentose. **LEAVES** pubescent, gradually reduced upward, deeply lobed once or twice, the lobes linear. **INFL** usually globose, with many subsessile flowers at the branch tips. **FLOWER** calyx 4–5 mm long, pubescent, the lobes acuminate; corolla campanulate, 7–12 mm long, blue to bluish violet, the tube equal to the calyx, the throat exserted; stamens inserted on the throat; anthers exserted; stigmas located among or above the anthers. **CAPSULES** 5–6 mm long, ovoid to globose. $2n = 18$. [*G. achilleifolia* Benth. subsp. *staminea* (Greene) H. Mason & A. D. Grant]. Canyons, washes; piñon-juniper woodland communities. NMEX: SJn. 1600–1900 m (5000–5600'). Flowering: Mar–May. Fruit: Apr–May. Our plants belong to **subsp. *staminea*** (Greene) V. E. Grant. Native to the San Joaquin Valley and adjacent mountains of California. Escape from cultivation.

Gilia clokeyi H. Mason (for Ira Clokey, botanist) Clokey's gilia. Annual, 8–20 (35) cm tall, branched throughout. **STEMS** cobwebby-pubescent below, glandular above. **LEAVES** cobwebby-pubescent, reduced above the basal rosette; basal and lower deeply lobed, the lobes linear to oblong; cauline basally lobed or entire. **INFL** open, with 1–2 pedicelled flowers at branch tips. **FLOWER** calyx 2–5 mm long, the lobes acute; corolla funnelform, 4–7 mm long, the tube equal to the calyx, the throat pale blue to white, the lobes light to deep violet, yellow-spotted at base; stamens inserted on the throat; anthers located above the throat; stigma situated among the anthers. **CAPSULES** 3–6.5 mm long, globose to ovoid. $2n = 18$. Open, sandy soils; blackbrush, sagebrush, saltbush, piñon-juniper woodland, and mountain brush communities. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, SJn; UTAH. 1136–1900 m (3725–6200'). Flowering: Mar–Apr. California to Wyoming, south to Arizona and New Mexico. In most previous local floras, incorrectly referred to *G. inconspicua* (Sm.) Sweet, a species of the Columbia River valley, Oregon and Washington.

Gilia ophthalmoides Brand (eyelike, referring to the yellow throat) Eye-gilia. Annual, 8–30 cm tall, branched throughout. **STEMS** cobwebby-pubescent below, glandular above. **LEAVES** cobwebby-pubescent, reduced above the basal rosette; basal and lower leaves deeply lobed once or twice; cauline basally lobed or entire. **INFL** open, with 1–2 pedicelled flowers at the branch tips. **FLOWER** calyx 3–5 mm long, glabrous, the lobes acuminate; corolla funnelform, 7–12 mm long, the tube usually exserted, purple, the throat yellow, the lobes pink; stamens inserted on the throat; anthers exserted; stigma located among the anthers. **CAPSULES** 4–6 mm long, ovoid to subglobose. $2n = 36$. Adobe hills and flats; desert scrub and piñon-juniper woodland communities. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1136–2150 m (3725–7000'). Flowering: Apr–Jun. Southeast California to Utah, south to Arizona and New Mexico. Incorrectly referred to *G. inconspicua* (Sm.) Sweet in most previous local floras.

Gilia sinuata Douglas ex Benth. (strongly waved, referring to the leaf margins) Sinuate-leaf gilia, sinuate gilia. Annual, 9–30 (35) cm tall, simple or branched above rosette, glabrous and glaucous below, glandular above. **LEAVES** cobwebby-

pubescent on upper surface, abruptly reduced above the basal rosette; basal deeply lobed once, the lobes oblong; cauline clasping, dentate to entire. **INFL** open, with 1–3 short-pedicelled flowers at branch tips. **FLOWER** calyx 3–5 mm long, glandular, the lobes short-acuminate; corolla funnelform, 7–12 mm long, the tube exserted, purple and white striate, the throat yellow or purple-tinged below, the lobes white to lavender; stamens inserted on the throat; anthers exserted; stigmas located among or slightly above the anthers. **CAPSULES** 4–7 mm long, ovoid. $2n = 36$. Sandy soils, mesas; desert scrub and piñon-juniper woodland communities. ARIZ: Apa, Coc, Nav; COLO: Mon; NMEX: McK, SJn; UTAH. 1136–1900 m (3725–6200'). Flowering: Mar–May. Washington and Idaho, south to southern California, Arizona, and New Mexico. Incorrectly referred to *G. inconspicua* (Sm.) Sweet in most previous local floras. Our material differs significantly in floral morphology from the material around the type locality in Okanogan County, Washington. Grant (1956) has further demonstrated that it is reproductively isolated from the typical *G. sinuata*. Ours is likely an undescribed, cryptic species.

Giliastrum (Brand.) Rydb. Giliastrum

(*Gilia*, genus of Polemoniaceae, + *astrum*, referring to similarity with *Gilia*) Perennial herbs, sometimes flowering the first year, simple to branched, leafy to subscapose, glabrous or sparsely pubescent. **LEAVES** basal to alternate, gradually reduced upward, entire to pinnately lobed, the lobes completely confluent with the rachis, usually flat. **INFL** terminal, paniculate, open to congested, the basic unit composed of 2–5 pedicelled flowers subtended by a single bract, rarely solitary. **FLOWERS** actinomorphic; calyx tube membranes ruptured in fruit; corolla rotate to broadly funnelform, the tube, throat, and lobes often with the same hues; stamens equally inserted on the lower corolla tube; filaments equal or unequal in length; anthers included to exserted; style included to exserted. **FRUIT** a capsule, ovoid to spheroid; seeds 2–many per locule. Arid grasslands, shrublands, and woodlands. Nine species of western North America and the Andes of Argentina, South America (Porter 1998b).

Giliastrum acerosum (A. Gray) Rydb. (needle-shaped, referring to the leaves) Bluebowls. Perennial, 6–15 cm tall, branched at the base. **STEMS** 5–12, spreading to erect, woody below, glandular throughout. **LEAVES** slightly reduced upward; lower deeply pinnately lobed, the lobes needlelike; upper subpalmately lobed, the lobes 3–5. **INFL** open, with 1–3 pedicelled flowers at branch tips. **FLOWER** calyx 7–8 mm long, the lobes attenuate, needlelike; corolla broadly funnelform, 7–10 mm long, deep blue, the tube usually shorter than the calyx; stamens inserted on the lower tube; anthers located above the throat, bright yellow; stigma located among the anthers or slightly above. **CAPSULES** 4–5 mm long, broadly ovoid. $2n = 18$. [*Gilia rigidula* Benth. subsp. *acerosa* (A. Gray) Wherry]. Gravelly soils, rocky slopes, canyons; desert scrub and piñon-juniper woodland communities. ARIZ: Apa; NMEX: McK, SJn. 1300–1950 m (4200–6500'). Flowering: May–Sep. Fruit: Jun–Sep. Arizona to Texas and southward to northern Mexico.

Ipomopsis Michx. Skyrocket, Gilia

(*Ipomoea*, a genus of Convolvulaceae, + *opsis*, like) Annuals, perennial herbs, or subshrubs, simple to branched. **LEAVES** basal to alternate, entire to deeply pinnately lobed, gradually reduced upward, the lobes completely confluent with the rachis, flat to terete, usually linear to oblong. **INFL** terminal, paniculate, open to congested, the basic unit composed of 2–7 pedicelled flowers subtended by a single bract, these sometimes arranged along one side of the rachis. **FLOWERS** actinomorphic to slightly zygomorphic; calyx tube membranes usually ruptured in fruit; corolla rotate to salverform, white to purplish or red; stamens unequally inserted on the corolla tube or throat; filaments equal or unequal in length; anthers included to exserted; style included to exserted. **CAPSULES** ovoid. **SEEDS** 1–many per locule (Day 1980; Grant and Wilken 1986, 1988). Approximately 30 species of western North America, one species in the southeastern U.S., and one species in Andean South America.

1. Flowers in terminal, capitate clusters; corolla tube 3–8 mm long; stamens inserted on the upper throat between the lobes ..... (2)
1' Flowers usually in clusters at tips of lateral branches, the inflorescence a diffuse to congested panicle (open in *I. longiflora*); corolla tube 5–50 mm long (5–15 mm long in *I. multiflora*); stamens inserted on the tube or base of throat ..... (6)

2. Perennials, often branched and woody at base; stems 5–60 cm tall; seeds 1 per locule, sometimes locules empty.. (3)
2' Annuals, usually branching from the primary axis, 5–30 cm tall; seeds several per locule (except sometimes in *I. gunnisonii*) ..... (4)

3. Filaments shorter than the anthers, inserted at the sinuses of the corolla lobes ..... ***I. roseata***
3' Filaments longer than the anthers, inserted at the sinuses of the corolla lobes ..... ***I. congesta***

4. Lower cauline leaves linear and entire; seeds 1–2 per locule ..... ***I. gunnisonii***
4' Lower cauline leaves with 3–5 teeth or ovate to oblong lobes; seeds 2–3 (4) per locule ..... (5)

5. Outer inflorescence bracts leaflike, toothed; stems with short curly hairs; corolla tube 3–5 mm long, lobes 1–1.5 (1.8) mm long ..... ***I. polycladon***
5' Outer inflorescence bracts reduced, entire; stems with woolly hairs; corolla tube 4–8 mm long, lobes 2–3.5 (4) mm long ..... ***I. pumila***

6. Inflorescence diffusely branched, the flowers pedicelled, solitary or in pairs ..... ***I. longiflora***
6' Inflorescence open to narrow, often 1-sided, the flowers short-pedicelled to subsessile, in lateral, pedunculate clusters ..... (7)

7. Corollas scarlet to magenta ..... ***I. aggregata***
7' Corollas white, peach, lavender, or pale violet to purplish ..... (8)

8. Corolla tube 5–15 mm long; stamens inserted at the same level on the upper tube or throat ..... ***I. multiflora***
8' Corolla tube 15–50 mm long; stamens inserted unequally on the tube ..... (9)

9. Corollas pale lavender to white, the throat 4–6 mm wide, the lobes obovate, the apices rounded to apiculate ..... ***I. polyantha***
9' Corollas pale peach to lavender, the throat 2–4 mm wide, the lobes lanceolate, the apices acute to attenuate ..... ***I. tenuituba***

Ipomopsis aggregata (Pursh) V. E. Grant (clustered, referring to flowers) Skyrocket, scarlet gilia. Short-lived perennial, 20–100 cm tall, simple to branched at base. **STEMS** with short, glandular hairs, often with short, curly, eglandular hairs below. **LEAVES** subglabrous to short-pilose, deeply lobed. **INFL** diffuse to 1-sided, with subsessile to short-pedicelled flowers on lateral branches. **FLOWER** calyx 3–8 mm long, shortly glandular-pubescent, the lobes shorter than or equal to the tube and acuminate in Arizona; corolla usually scarlet, the tube 15–30 mm long, the throat 3–6 mm wide, the lobes lanceolate, acuminate, often with dark red flecks; stamens inserted unequally above the midtube; filaments unequal; anthers located in the throat or exserted; stigma slightly exceeding the anthers. **CAPSULES** 8–12 mm long. **SEEDS** 5–10 per locule. [*Gilia aggregata* (Pursh) Spreng.]. Approximately seven subspecies; western North America. The Kayenta Navajo used the plant as a cathartic, for spider bites, as an emetic, and for stomach disease. The Ramah applied an infusion to the body of a hunter and weapons for good luck. The Hopi used it for a beverage, dye, and for decoration. The Ute boiled the plant for glue.

1. Corolla pale, pink (rarely red), anthers included, from the orifice to about 4 mm below the orifice ..... **subsp. *collina***
1' Corolla various shades of red, usually crimson, anthers exserted or close to the orifice ..... (2)

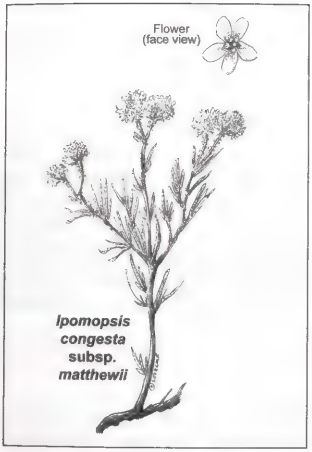
2. Anthers all well exserted from the orifice of the corolla tube, 3–5 mm beyond the orifice ..... **subsp. *formosissima***
2' Anthers all close to the orifice of the corolla tube, from 2 mm beyond to 2 mm below the orifice ..... **subsp. *aggregata***

subsp. *aggregata* Corolla scarlet with yellow spotting at the orifice, tube 18–20 mm long, the throat 3–4 mm wide; anthers close to the orifice, from 2 mm beyond to 2 mm below the orifice, stigma usually at the orifice. $2n = 14$. Open sites; ponderosa pine and other coniferous forest communities. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, RGr, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1680–2840 m (5000–10500'). Flowering: May–Sep. Fruit: June–Sep.

subsp. *collina* (Greene) Wilken & Allard (pertaining to hills) Corolla pink or red with pink or white spotting at the orifice, tube 20–25 mm long, the throat 2–4 mm wide; anthers at the orifice to 4 mm below the orifice, stigma usually at the orifice. $2n = 14$. Open sites; ponderosa pine, Douglas-fir, and spruce-fir communities. ARIZ: Apa; COLO: Arc, LPl; NMEX: RAr. 1680–2840 m (6000–9000'). Flowering: May–Sep. Fruit: Jun–Sep.

subsp. *formosissima* Wherry (greatly beautiful) Corolla scarlet with yellow spotting at the orifice, tube 18–25 mm long, the throat 4–8 mm wide; anthers and stigma usually exserted, longest anthers 3–5 mm beyond the orifice. $2n = 14$. [*Gilia aggregata* (Pursh) Spreng. var. *maculata* M. E. Jones; *G. aggregata* var. *texana* (Greene) I. M. Johnst.]. Open sites; piñon-juniper woodland, ponderosa pine, Douglas-fir, and spruce-fir communities. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, SJn; UTAH. 1680–2840 m (5500–9300'). Flowering: May–Sep. Fruit: Jun–Sep.

Ipomopsis congesta (Hook.) V. E. Grant (crowded together, referring to flowers) Ballhead gilia. Perennial, herbaceous to woody at base, 20–60 cm tall, simple to branched at base. **STEMS** with short, white, curly or woolly hairs. **LEAVES**



subglabrous to short-woolly, entire to pinnately or palmately lobed. **INFL** a dense terminal head, bracteate; flowers subsessile to sessile. **FLOWER** calyx 3–4 mm long, the lobes lanceolate, acuminate; corolla white, the tube 3–5 mm long, the throat 0.5–1 mm wide, the lobes rounded, sometimes with pinkish flecks; stamens inserted on the throat between the lobes; filaments subequal; anthers and stigma slightly exserted. **CAPSULES** 1.5–2 mm long. **SEEDS** 1–2 per locule. $2n = 14$. Eight to 10 subspecies. Western North America.

1. Stems mostly simple, tall and wandlike; some cauline leaves entire but others pinnatifid; flowers white; 2 ovules per locule ..... **subsp. *frutescens***

1′ Stems short and branched; all cauline leaves simple and entire; flowers cream-colored; 1 ovule per locule ..... **subsp. *matthewii***

subsp. *frutescens* (Rydb.) A. G. Day **STEMS** tall and wandlike, several, woody at base, with short, curly hairs. **LEAVES** entire. Rocky outcrops, gravelly soils; piñon-juniper woodland communities. ARIZ: Nav. 1525–1620 m (5000–5300′) Flowering: Jul–Aug. Fruit: late Jul–Sep. Southwestern Utah, south to northwestern Arizona.

subsp. *matthewii* J. M. Porter **CP** (honoring Matthew Heil, botanist) **STEMS** short, several, woody at base, with short, curly hairs. **LEAVES** entire to pinnatifid. Rocky outcrops, gravelly soils; piñon-juniper woodland communities. ARIZ: Apa; COLO: Arc, LPl, Mon; NMEX: SJn; UTAH. 1525–1700 m (5000–6000′). Flowering: Jul–Aug. Fruit: late Jul–Sep. Western Colorado to eastern Utah, south to northwestern New Mexico and northeastern Arizona.

Ipomopsis gunnisonii (Torr. & A. Gray) V. E. Grant (for John W. Gunnison, surveyor) Gunnison's gilia. Annual, 3–30 cm tall, simple to branched. **STEMS** glabrous or with short glandular hairs. **LEAVES** glabrous to sparsely short-pilose, entire to remotely few-toothed. **INFL** with flowers congested in terminal heads, bracteate; flowers subsessile. **FLOWER** calyx 3–4.5 mm long, glabrous to sparsely glandular, the lobes acuminate; corolla white to pale lavender, the tube 4–7 mm long, throat 0.5–1 mm wide, the lobes rounded; stamens inserted on the upper tube or throat; filaments subequal; anthers and stigma slightly exserted. **CAPSULES** 3–4 mm long. **SEEDS** 1–2 per locule. $2n = 14$. [*Gilia gunnisonii* Torr. & A. Gray]. Sandy soils; desert scrub, shadscale, sagebrush, and piñon-juniper woodland communities. ARIZ: Apa, Nav; COLO: Mon; NMEX: SJn; UTAH. 1280–2200 m (4200–7200′). Flowering: May–Jul (Sep). Fruit: Jun–Sep. Southern Utah to southwest Colorado, south to Arizona and New Mexico. Used as a blood purifier and poultice for sores by the Kayenta Navajo.

Ipomopsis longiflora (Torr.) V. E. Grant (long flower) Annual in Arizona or biennial, 25–100 cm tall, simple to branched. **STEMS** glabrous to sparsely short-pubescent. **LEAVES** glabrous to sparsely short-pilose, deeply lobed. **INFL** diffuse, with 1–3 subsessile to long-pedicelled flowers at tips of branches. **FLOWER** calyx 5–10 mm long, shortly glandular-pubescent, the lobes lanceolate to ovate, acuminate, glabrous to sparsely short-pubescent, the calyx 6–11 mm long in fruit; corolla white to bluish, tube 30–50 mm long, the throat 2–3 mm wide, the lobes ovate, rounded to acuminate; stamens inserted on the tube; filaments unequal; anthers included to exserted; stigma slightly exceeding the anthers. **CAPSULES** 10–15 mm long. **SEEDS** 8–15 per locule. $2n = 14$. [*Gilia longiflora* (Torr.) G. Don]. Three subspecies, Utah to South Dakota, south to Texas and northern Mexico. Open sites, washes, sandy soils; desert scrub, sagebrush, piñon-juniper. ARIZ: Apa, Coc, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1136–1980 m (3725–6500′). Flowering: May–Sep. Fruit: Jun–Sep. Utah to Colorado, south to northern Sonora and northern Chihuahua, Mexico. In our area we find only **subsp. *neomexicana*** Wilken (of New Mexico). The Hopi used a decoction of leaves for stomachache. For the Navajo it is used as a ceremonial medicine plant in the Wind and Female Shooting Chants; a decoction of pounded plant taken to vomit; infusion of flowers mixed with feed and given to sheep for stomach problems.

Ipomopsis multiflora (Nutt.) V. E. Grant (many flowers) Many-flowered gilia. Short-lived perennial, 15–50 cm tall, simple to branched at base; stems with short to long, glandular to nonglandular hairs. **LEAVES** glabrous to sparsely short-pilose or glandular, the lower deeply lobed, the upper entire to few-lobed. **INFL** somewhat diffuse to 1-sided, with subsessile flowers crowded on short, lateral branches. **FLOWER** calyx 4–8 mm long, shortly glandular-pubescent, the lobes short-aristate; corolla pale violet to purplish, the tube 5–15 mm long, the throat 1–2.5 mm wide, the lobes subequal, the lower 3 partly united, often with purple flecks; stamens inserted on the upper tube or throat; filaments

unequal; anthers exserted; stigma slightly exceeding the anthers. **CAPSULES** 4.5–7 mm long. **SEEDS** 2–8 per locule. [*Gilia multiflora* Nutt.]. Open sites; desert grasslands, piñon-juniper woodland, and ponderosa pine communities. ARIZ: Apa; NMEX: McK, RAr, San, SJn. 1525–2590 m (5000–8500'). Flowering: Jul–Oct. Fruit: Aug–Oct. Southern Colorado, New Mexico, and Arizona (perhaps also in northern Chihuahua, Mexico). The Ramah Navajo used a decoction of the plant as a ceremonial medicine. The Zuni powdered the plant and applied it to the face for headache.

Ipomopsis polyantha (Rydb.) V. E. Grant **CP** (many flowers) Pagosa skyrocket. Short-lived monocarpic perennial, 25–60 cm tall, simple, branched toward the apex. **STEMS** with short to long, glandular to nonglandular hairs. **LEAVES** 3–4 cm long, pinnatifid, glabrous to sparsely short-pilose or glandular. **INFL** narrow, somewhat diffuse, with short-pedicelled flowers crowded on short, lateral branches. **FLOWER** calyx 4–5 mm long, shortly glandular-pubescent, the lobes cuspidate-pungent; corolla 0.9–1.4 cm long, white to pale violet, the tube 4.5–6.5 mm long, the throat 1.5–2.5 mm wide, the lobes subequal, widely spreading, often with purple flecks; stamens inserted on the upper tube or throat; filaments unequal; anthers well exserted; stigma slightly exceeding the anthers. **CAPSULES** 4.5–6 mm long. **SEEDS** 2–8 per locule. $2n = 14$. [*Gilia polyantha* Rydb.]. Clay soils of roadsides and open forests; ponderosa pine and mountain brush communities. COLO: Arc. 1980–2300 m (6500–7500'). Flowering: May–Aug. Fruit: Jun–Aug. This species is endemic to the Pagosa Springs area of Archuleta County.

Ipomopsis polycladon (Torr.) V. E. Grant (many branches) Spreading gilia, internode gilia. Annual, 4–12 cm tall, usually with ascending to spreading branches. **STEMS** with short glandular hairs and some eglandular curly hairs. **LEAVES** subglabrous to shortly glandular-pubescent, coarsely toothed to lobed, the lobes ovate. **INFL** a congested terminal head, bracteate, the outer bracts leaflike; flowers sessile to subsessile. **FLOWER** calyx 3–6 mm long, the lobes lanceolate, acuminate; corolla white, the tube 3–5 mm long, the throat 0.5–1 mm wide, the lobes rounded; stamens inserted on the throat between the lobes; filaments subequal; anthers and stigma slightly exserted. **CAPSULES** 4–5 mm long. **SEEDS** 1–3 per locule. $2n = 14$. [*Gilia polycladon* Torr.]. Sandy or gravelly soils, washes; desert scrub, blackbrush, and piñon-juniper woodland communities. ARIZ: Apa, Nav; COLO: Mon; NMEX: McK, RAr, SJn; UTAH. 1136–1920 m (3725–6300'). Flowering: Apr–Jun. Fruit: May–Jul. Eastern California to southern Idaho, south to Texas and northern Mexico. Used as a sedative and tonic by the Kayenta Navajo.

Ipomopsis pumila (Nutt.) V. E. Grant (dwarf, short) Dwarf gilia, eriastrum gilia. Annual, 3–18 cm tall, simple to branched. **STEMS** short-glandular to short-woolly. **LEAVES** subglabrous to short-woolly, often glandular, lower deeply lobed, upper lobed to entire. **INFL** a congested terminal head, bracteate, the bracts entire to toothed; flowers subsessile. **FLOWER** calyx 3–6 mm long, the lobes lanceolate, acuminate; corolla lavender to purplish, the tube 4–8 mm long, the throat 0.5–1 mm wide, the lobes acute to rounded; stamens inserted on the throat between the lobes; filaments subequal; anthers and stigma slightly exserted. **CAPSULES** 3–5.5 mm long. **SEEDS** 2–5 per locule. $2n = 14$. [*Gilia pumila* Nutt.]. Sandy soils; desert scrub, sagebrush, and piñon-juniper woodland communities. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1490–1920 m (4900–6300'). Flowering: Mar–Jun (Oct). Fruit: Apr–Oct. Utah to Wyoming, south to Texas and New Mexico.

Ipomopsis roseata (Rydb.) V. E. Grant (provided with a rose color) Roseate gilia. Perennial, 10–30 cm tall, simple to branched at base; stems often woody at base, with white curled hairs, or short glandular hairs, or glabrous. **LEAVES** with white curled hairs to sparsely glandular, or subglabrous, deeply pinnatifid to entire. **INFL** sparse to dense cymose heads, with subsessile flowers, terminating the branches. **FLOWER** calyx 5.5–8.5 mm long, the lobes spinulose-tipped; corolla cream to white, the tube 7–9 mm long, the throat 1.5–3 mm wide, the lobes 2.5–4 mm long, ovate to obovate, rounded; stamens inserted at the sinuses of the lobes; filaments equal to or shorter than the anthers; anthers partially exserted; stigma included. **CAPSULES** 3–6 mm long; seeds 1 per locule. $2n = 28$. [*Gilia roseata* Rydb.]. Sandstone outcrops and rocky slopes; blackbrush, desert scrub, sagebrush, and piñon-juniper communities. UTAH. 1190–2290 m (4000–7300'). Flowering: May–Jun. Fruit: late May–Jul. Colorado and Utah.

Ipomopsis tenuituba (Rydb.) V. E. Grant (thin, fine tube) Short-lived perennial, 35–100 cm tall, simple to branched at base. **STEMS** often woody at base, with short glandular hairs, eglandular below. **LEAVES** subglabrous to sparsely short-pilose, deeply lobed. **INFL** narrow, 1-sided, with subsessile to short-pedicelled flowers on lateral branches. **FLOWER** calyx 4–6 mm long, shortly glandular-pubescent, the lobes acute to acuminate; corolla white to lavender, the tube 25–35 mm long, the throat 2–4 mm wide, the lobes lanceolate to ovate, acuminate to apiculate, often with pink to lavender flecks; stamens inserted unequally on the tube; filaments unequal; anthers included to slightly exserted; stigma slightly exserted. **CAPSULES** 5–8 mm long. **SEEDS** 6–12 per locule. $2n = 14$. [*Gilia tenuituba* Rydb.]. Open sites, meadows, ponderosa pine, and spruce-fir communities. COLO: LPl, Mon; UTAH. 2140–2760 m (7000–9050'). Flowering:

Jul–Sep. Fruit: Aug–Sep. Oregon to Idaho, south to California, Colorado, and Arizona. In our area this species is represented by **subsp.** ***tenuituba***. Hybridization occurs with *I. aggregata* subsp. *formosissima*, the hybrids being intermediate in corolla size and color.

Leptosiphon Benth. Leptosiphon

(narrow tube) Annuals or perennials. **STEMS** simple to much-branched, erect to decumbent, leafy. **LEAVES** opposite, rarely alternate above, palmately lobed, the lobes confluent with the rachis, linear, flat to terete, acute to weakly spinulose. **INFL** terminal or axillary, compact and capitate, glabrous, pubescent, or glandular. **FLOWERS** pedicelled, actinomorphic; calyx tube membranes very narrow, usually ruptured or distended in fruit, the lobes equal, linear to attenuate, often mucronate; corolla white to yellowish or lavender; stamens equally inserted on the corolla throat or tube; anthers slightly exserted or included; filaments equal in length; style included to exserted. **CAPSULES** ovoid to oblong. **SEEDS** 1–several per locule (Patterson 1977). About 30 species in southwestern North America and one species in South America; one species in our area.

Leptosiphon nuttallii (A. Gray) J. M. Porter & L. A. Johnson (honoring Thomas Nuttall, naturalist) Suffrutescent perennial to 3 dm tall, branching at the base; stems erect, glabrous to short-pubescent. **LEAVES**: lobes (4) 5–9, linear to oblong, spinulose, 10–20 mm long, short-pubescent. **INFL** compact, the flowers 2–5 in terminal, bracteate clusters. **FLOWERS** subsessile; calyx glabrous to pubescent, narrowly campanulate, 7–10 mm long, the lobes longer than the tube, the membranes mostly herbaceous, the hyaline part narrow, often obscure; corolla diurnal, salverform, 8–15 mm long, the tube and lobes white, the throat yellow; stamens inserted on the throat; style slightly exserted. $2n = 18$. [*Linanthus nuttallii* (A. Gray) Greene ex Milliken; *Linanthastrum nuttallii* (A. Gray) Ewan]. Sandy to rocky soils; meadows, sagebrush, piñon-juniper woodland, ponderosa pine, aspen, spruce-fir forests, and oak woodland communities. ARIZ: Apa; COLO: Arc, Con, Hin, Min, RGr; NMEX: McK, RAr; UTAH. 1650–2600 m (5400–8500'). Flowering: May–Sep. Fruit: June–Sep. Washington to Colorado, south to California, New Mexico, and northwestern Mexico. Our material is referred to **subsp.** ***nuttallii***, with leaf lobes linear to linear-lanceolate.

Linanthus Benth. Linanthus

(flax-flower) Annuals or perennials. **STEMS** simple to much-branched, erect to decumbent, leafy. **LEAVES** mostly opposite, sometimes alternate above, simple to deeply palmately lobed, the lobes confluent with the rachis, linear, flat to terete, acute to weakly spinulose. **INFL** terminal and compact or axillary, glabrous to glandular. **FLOWERS** sessile to short-pedicelled, actinomorphic; calyx tube membranes ruptured or distended in fruit, the lobes equal, linear to attenuate, often mucronate; corolla white to yellow or lavender, sometimes bluish; stamens equally inserted on the corolla throat or tube; anthers exserted or included; filaments equal in length; style included to exserted. **CAPSULES** ovoid to oblong. **SEEDS** 1–several per locule (Bell and Patterson 2000). About 24 species in western North America.

1. Plants with erect stems, 10–80 cm tall; lower leaves opposite, upper leaves usually alternate; sepals, petals, and stamens 5 ..... ***L. pungens***
1' Plants loosely matted or sprawling, stems 5–11 cm tall; leaves usually all opposite; sepals, petals, and stamens often 6 ..... ***L. watsonii***

Linanthus pungens (Torr.) J. M. Porter & L. A. Johnson (sharp-pointed) Prickly phlox. Subshrub, 1–4 dm tall, branching mostly below the middle; stems ascending to erect, glandular and pilose. **LEAVES** opposite below, alternate above, palmately to pinnately lobed, 5–12 mm long, the 3–9 lobes linear to narrowly oblong, glabrous to pubescent, spinulose, the upper leaves subtending clusters of short leaves. **FLOWER** calyx 6–10 mm long, 5-merous, glabrous to sparsely pubescent, the lobes slightly unequal, usually shorter than the tube; corolla nocturnal, closed during the day, 5-merous, salverform, 14–20 (25) mm long, cream to salmon, the throat often tinged lavender or purple; stamens 5, inserted on the upper tube; stigmas 3; ovary with 3 locules. [*Leptodactylon pungens* (Torr.) Rydb.]. Sandy to rocky soils; sagebrush, piñon-juniper woodland, mountain brush, and ponderosa pine communities. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1700–2100 m (5600–7000'). Flowering: May–Sep. Fruit: late May–Sep. British Columbia to Montana, south to California and New Mexico. Used for scorpion stings and kidney disease by the Kayenta Navajo. A decoction of the plant was used for "snake infection" by the Ramah Navajo.

Linanthus watsonii (Torr.) J. M. Porter & L. A. Johnson (for Sereno Watson, geologist, explorer, botanist) Watson's leptodactylon. Sprawling to loosely matted subshrub, 5–12 cm tall, branching mostly at the base. **STEMS** ascending to erect, glandular and puberulent. **LEAVES** opposite, 6–20 mm long, palmately lobed, the 3–9 lobes linear to narrowly oblong, glandular-pubescent, spinulose, often somewhat rigid. **FLOWER** calyx 6–10 mm long, glabrous to sparsely

pubescent, the lobes distinctly unequal, shorter than the tube, usually 6-merous; corolla nocturnal, closed during the day, usually 6-merous, salverform, 14–20 (25) mm long, cream to salmon, the throat often tinged lavender or purple; stamens usually 6, inserted on the upper tube; stigmas 3 or 4; ovary with 3–4 locules. [*Leptodactylon watsonii* (Torr.) Rydb.]. Crevices in granite and sandstone, sandy to rocky soils; blackbrush, sagebrush, pinon-juniper, mountain brush, and ponderosa pine communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; UTAH. 1700–2100 m (5600–7000'). Flowering: May–Aug. Fruit: Jun–Sep. Idaho south to Nevada and northern Arizona, east to western Wyoming, Utah, and Colorado.

Microsteris Greene Microsteris

(tiny star, referring to the small, starlike corolla) Annuals. **STEMS** erect to ascending, often much-branched. **LEAVES** mostly opposite, often alternate above and in the inflorescence, simple, entire, linear to elliptic or lanceolate. **INFL** terminal, the flowers 1–3. **FLOWERS** pedicelled to subsessile; calyx tube membranes ruptured in fruit, the lobes equal; corolla salverform, white to bluish; stamens unequally inserted on the tube; filaments short, usually equal in length, glabrous; anthers and style usually included. **CAPSULES** ovoid to ellipsoid. **SEEDS** 1 (2–3) per locule, conspicuously gelatinous when wet. $2n = 14$. One or two species. North America and South America.

Microsteris gracilis (Douglas ex Hook.) Greene (slender) Little polecat. Annual with 1–3 erect stems, 3–15 cm tall, often branched below, the lower stems ascending or spreading. **LEAVES** linear to elliptic or narrowly oblanceolate, pubescent and glandular, 1–2 (4) cm long, 2–5 mm wide. **INFL** flowers 1–2, subsessile to pedicelled at tips of terminal branches, sometimes axillary; pedicels glandular. **FLOWER** calyx 3–8 mm long; corolla white to bluish lavender, the throat sometimes yellow-tinged, the tube 4–8 mm long, the lobes 1–2 mm long, obtuse to retuse; stamens inserted on the upper tube and throat; stigmas located among the lower stamens. **SEEDS** gelatinous when wet. [*Phlox gracilis* (Hook.) Greene]. Open, sandy to gravelly sites; sagebrush, piñon-juniper woodlands, mountain brush, and ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1220–2450 m (4000–8000'). Flowering: Mar–Aug. Fruit: Apr–Aug. Southern British Columbia to Montana, south to Arizona and New Mexico; Baja California, northern Sonora, Mexico.

Navarretia Ruiz & Pav. Navarretia

(for Francisco Fernandez Navarrete, Spanish botanist, physician) Annuals. **STEMS** erect to prostrate. **LEAVES** mostly alternate, sometimes opposite below, twice pinnately lobed in Arizona, the lobes narrow, rigid, and spinulose. **INFL** terminal and axillary, compact, capitate, bracteate, the bracts pinnately to palmately lobed, villous to glandular, spinulose. **FLOWERS** actinomorphic, sessile; calyx membranes usually remaining intact in fruit, the lobes usually unequal, linear to acuminate, spinulose; corolla (4) 5-merous, salverform to funnelform, white, yellow, or blue; stamens inserted at the same level on the upper tube or throat; filaments mostly equal in length; anthers included in the throat or exserted; style included or slightly exserted, the stigmatic lobes 2–3, short or obscure. **CAPSULES** ovoid to ellipsoid, dehiscent to indehiscent; seeds 1–7 per locule, gelatinous when wet (Day 1993b). About 30 species of western North America; one in Chile.

1. Corolla yellow, vascular traces in the upper tube 3 per lobe; stigma lobes 3; calyx lobe sinus U-shaped, intercostal region truncate ..... ***N. breweri***

1' Corolla white to pale lavender or blue, vascular traces in the upper tube 1 per lobe; stigma lobes 2; calyx lobe sinus V-shaped ..... ***N. intertexta***

Navarretia breweri (A. Gray) Greene (for William H. Brewer, botanist, geologist) Brewer's pincushion. Plants 3–7 cm tall. **STEMS** mostly erect, simple or branching above, reddish brown, densely pubescent. **LEAVES** 8–18 mm long, glabrous to short-pubescent, the rachis flattened, the lobes linear, the lateral lobes 2–6, mostly simple. **INFL** terminal, compact, subcapitate, the bracts similar to the cauline leaves. **FLOWERS** subsessile; calyx 7–10 mm long, the tube glandular short-pubescent, the lobes simple; corolla salverform, yellow, 6–8 mm long; stamens inserted on the upper tube below the sinuses; filaments 1–2 mm long; anthers exserted; style exserted; stigmatic lobes mostly 3, situated below the anthers. **CAPSULES** broadly ovoid, mostly 3-locular, dehiscent, 3–5 (8) mm long; seeds 1–2 (3) per locule. $2n = 18$. Infrequent on rocky or shallow clay soils of dry meadows and flats; sagebrush, piñon-juniper woodland, and ponderosa pine communities. ARIZ: Coc; COLO: Arc, Dol, LPl, Mon, SMg; UTAH. 2290–2560 m (7500–8400'). Flowering: Jun–Aug. Fruit: Jul–Sep. Washington and Idaho, east to Alberta and Colorado, south to Baja California and northern Arizona.

Navarretia intertexta (Benth.) Hook. (between woven) Plants simple or branched, 3–11 cm tall. **STEMS** puberulent to more or less villous in the inflorescence. **LEAVES** up to 3 cm long, pinnatifid, rachis narrow, terminal segment generally

elongate. **INFL** terminal, compact, subcapitate, the bracts with broader, firmer rachis than leaves. **FLOWERS** subsessile; calyx white-hairy at the internal orifice, the intercostal membranes V-shaped, the lobes more or less unequal, the larger ones often trifid; corolla white to pale lavender or pale blue, 4–7 mm long, usually surpassed by the calyx; filaments mostly 0.5–2 mm long; stigma lobes 2 (very rarely 3); ovary 2-locular, with (2) 3–5 ovules and seeds per locule. **CAPSULES** ovoid, indehiscent, or tardily dehiscent. $2n = 18$. Ephemerally moist sites, edges of drying ponds, lakes, or reservoirs; meadows, sagebrush, and ponderosa pine communities. COLO: Arc, Hin, LPl, Mon. 1830–2560 m (6000–8400'). Flowering: Jun–Sep (Oct). Fruit: Jul–Oct. Southern Canada to Colorado and Arizona, south to Baja California, Mexico. Our material belongs to **subsp.** ***propinqua*** (Suksd.) A. G. Day (near, referring to similarity to *N. intertexta*).

Phlox L. Phlox

(flame, referring to the brightly colored corollas) Perennial, often caespitose. **STEMS** erect to decumbent, often much-branched. **LEAVES** mostly opposite, often alternate only in the inflorescence, simple, entire, linear to elliptic or lance-olate. **INFL** terminal, the flowers 1–3. **FLOWERS** pedicelled to sessile; calyx tube membranes ruptured in fruit, the lobes equal; corolla salverform, white to red, blue, or purple; stamens unequally inserted on the tube; filaments short, usually equal in length, glabrous; anthers and style usually included. **CAPSULES** ovoid to ellipsoid. **SEEDS** 1 (2–3) per locule, usually not gelatinous when wet. $2n = 14, 28, 42$. Seventy species in North America, one in Siberia (Wherry 1955). The genus *Phlox* is both complex and very poorly understood. Wherry, the most recent monographer of *Phlox*, recognized as many as 22 taxa within the boundaries of the *Flora*. Based upon recent floristic treatments in adjacent states, most current authors would recognize only 10 taxa. Actual diversity likely lies somewhere between these two estimates. Following is a relatively conservative treatment recognizing 13 taxa in our area.

1. Plant habit relatively loose and erect, the stems scattered or few together, often more than 10 cm tall, most of the leaves well spaced and not forming a basal cluster or mat; flowers born on pedicels, in loosely branched, terminal cymes ..... (2)
1' Plant habit more compact, the stems numerous and low, generally less than 10–15 cm tall, forming loose to dense mats or mounds; flowers sessile or inconspicuously short-pedicelled, 1–3 (6) together at the stem tips ..... (8)

2. Intercostal membranes of the calyx plicate or strongly bulged-carinate toward the base ..... (3)
2' Intercostal membranes of the calyx flat or inconspicuously wrinkled, not keeled or bulged ..... (5)

3. Calyx intercostal membrane plicate; corolla tube 19–25 mm long; style 15–21 mm long ..... ***P. standsburyi***
3' Calyx intercostal membrane bulged-carinate; corolla tube 11–18 mm long; style 8–15 (16) mm long ..... (4)

4. Stems generally with 4 leaf-bearing nodes below the inflorescence; leaves thick-textured, 12–30 (35) mm long, (2) 3–6 (8) mm wide ..... ***P. grayi***
4' Stems generally with 5–6 leaf-bearing nodes below the inflorescence; leaves moderate to thin-textured, 25–90 mm long, 1–5 mm wide ..... ***P. longifolia***

5. Corolla lobes retuse, evidently notched at the tip, the notch 1–2 mm deep, so that collectively the lobes appear 10-pointed; styles 1–2.5 mm long; stems several from a woody base ..... ***P. woodhousii***
5' Corolla lobes entire, wavy, erose, or slightly emarginate, but not retuse; styles 2–18 mm long; stems not from a woody base ..... (6)

6. Stamens inserted in the middle to lower tube; style short, 2–3 mm long; corolla tube glandular-pilose ..... ***P. nana***
6' Stamens inserted in the upper tube; style long, 8–18 mm long; corolla tube glabrous ..... (7)

7. Stems scattered on a creeping rhizome, forming widely spaced colonies of vegetative and reproductive stems; floral pedicels glandular-pubescent, 8–18 mm long ..... ***P. cluteana***
7' Stems loosely clustered on a taproot and branching caudex, or the plant with a branching, woody base; floral pedicels eglandular, up to 25 mm long ..... ***P. caryophylla***

8. Intercostal membranes of the calyx carinate, though sometimes weakly so ..... (9)
8' Intercostal membranes of the calyx flat or inconspicuously wrinkled, not carinate (sometimes obscured by the pubescence) ..... (10)

9. Keel of the intercostal membrane conspicuous; inflorescence densely, often appressed pubescent to glabrescent ..... ***P. austromontana***
9' Keel of the intercostal membrane weak and inconspicuous, low, linear (but distinct); inflorescence finely pubescent to glabrescent ..... ***P. diffusa***

10. Pubescence of the calyx tangled-woolly, usually copious and obscuring the intercostal membranes, never glandular ..... (11)
10' Pubescence of the calyx various or absent, when present, not tangled-woolly or obscuring the intercostal membranes, often glandular ..... (12)

11. Leaves firm and pungent, narrowly linear, mostly (2.5) 4–10 (13) mm long and 0.5–1 mm wide near the middle, usually somewhat arachnoid-woolly, but varying to essentially glabrous; common in the foothills and lowlands, seldom ascending to middle elevations in the mountains ..... ***P. canescens***
11' Leaves softer and larger, mostly 5–20 mm long and (0.5) 1–2 mm wide, green and glabrous except for the often basally arachnoid-ciliate margins; more montane ..... ***P. diffusa***

12. Style elongate, 5.5–8 mm long; calyx glabrous or seldom inconspicuously arachnoid-puberulent; leaves relatively soft and lax, rather sparsely granular-scaberulous, otherwise essentially glabrous, the better-developed ones mostly (10) 12–30 mm long; montane ..... ***P. multiflora***
12' Style short, 2–5 mm long; calyx usually glandular-hairy, seldom eglandular or even glabrous; leaves linear-subulate, firm, erect and appressed or arcuate, glandular, pilose or glabrous, mostly 5–12 (15) mm long ..... (13)

13. Stems tending to be interlaced; leaves arcuate and spreading; styles 2.5–5.5 mm long ..... ***P. pulvinata***
13' Stems tending to be discrete and subparallel; leaves erect and appressed; styles 1.5–3 mm long .. ***P. condensata***

Phlox austromontana Cov. (southern mountains) Desert phlox. Compact, matted, sometimes more open and spreading, taprooted perennial, with 8–many decumbent to ascending stems. **STEMS** 6–10 (15) cm long, the lower internodes obscured by the leaves. **LEAVES** linear, firm, thick, grayish green, mucronate, mostly glabrous on the lower surface, glabrous to more often pubescent on the upper surface, 8–15 (18) mm long, 1–2 mm wide, midrib and margins thickened, giving the lower surface a 2-grooved appearance. **INFL** flowers solitary, rarely to 5, subsessile. **FLOWER** calyx 6–10 (12) mm long, the membranes weakly ridged to distended, glabrous to densely white-pubescent; corolla white to light lavender, rarely blue, the tube 8–18 mm long, the lobes 5–8 mm long, obovate, obtuse; stamens inserted on the upper tube; stigmas located below most of the stamens, subequal to the calyx. **FRUIT** obovate, apex acute, 3.5–6 mm long, 1.5–2.5 mm wide. **SEEDS** elliptic, acute on one end, 2.8–3.5 mm long, 1.2–1.5 mm wide. Rocky soils, slopes; coniferous forest and woodland communities. 1250–2800 m (4100–9000'). Flowering: Apr–Jul. Nevada and Idaho south to Baja California, Mexico. The plant was crushed and placed in cavity for toothaches by the Kayenta Navajo.

1. Stems open and more or less spreading, internodes apparent ..... **subsp.** ***prostrata***
1' Stems compact, internodes obscured by leaves ..... (2)

2. Flowers white or less often pink to blue; calyx turbinate to subcylindric ..... **subsp.** ***austromontana***
2' Flowers cream, fading lemon-yellow; calyx campanulate ..... **subsp.** ***lutescens***

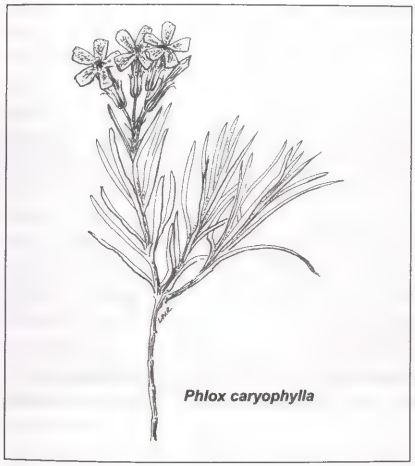
subsp. ***austromontana*** Desert scrub, piñon-juniper woodland, sagebrush, and ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: Arc, Hin, LPl, Mon; NMEX: RAr, SJn; UTAH. 1500–3000 m (4920–9840'). Flowering: May–Jun. Fruit: Jun–Jul.

subsp. ***lutescens*** (Welsh) J. M. Porter (becoming yellow) Yellow desert phlox. Blackbrush, desert scrub, and piñon-juniper woodland communities. ARIZ: Apa; UTAH. 1300–2050 m (4265–6725'). Flowering: May–Jun. Fruit: (late May) Jun–Jul.

subsp. ***prostrata*** (E. E. Nelson) Wherry (reclined) Silver reef phlox. Mountain brush and piñon-juniper woodland communities. UTAH. 1250–1300 m (4100–4265'). Flowering: May–Jun. Fruit: Jun–Jul.

Phlox canescens Torr. & A. Gray (becoming gray) Compact, matted perennial with many decumbent stems. **STEMS** 2–5 cm tall, the internodes obscured by the leaves, densely pubescent to woolly. **LEAVES** linear, firm, thick, green, subulate, 6–10 (12) mm long, 1–2 mm wide, the margins and midrib often thick, glabrous to densely cobwebby-woolly below. **INFL** flowers solitary, sessile to subsessile. **FLOWER** calyx 5–9 mm long, the membranes flat or wrinkled, the lobe margins glabrous, glandular, or woolly; corolla white to light lavender, the tube 8–12 mm long, the lobes 4–7 mm long, obtuse; stamens inserted from the middle to the upper tube; stigma located among the stamens, subequal to much longer than the calyx. **FRUIT** obovoid, apex acute, 3.5–4.5 mm long, 1.8–2.2 mm wide. **SEEDS** 1 or fewer per locule, 2.5–3 mm long, 0.8–1.2 mm wide, oblong. [*P. hoodii* Richardson subsp. *canescens* (Torr. and A. Gray) Wherry].

Gravelly soils, rocky slopes and ledges; desert grassland, desert scrub, piñon-juniper woodland, and ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1950–2700 m (5500–8800'). Flowering: Apr–May (Aug). Fruit: May–Sep. Washington south to California and east to Colorado and northwestern New Mexico.



Phlox caryophylla Wherry (nut leaf, referring to the clove or carnation-like fragrance of the flowers) Clove phlox. Open-tufted, woody-based perennials. **STEMS** 10–25 cm long, pilose-pubescent, eglandular, internodes elongate. **LEAVES** linear, oblong, or narrowly elliptic, acute to acuminate, 3–5.5 cm long and 2–4 mm wide. **INFL** composed of 3–12 flowers, the pedicels up to 25 mm long. **FLOWER** calyx 11–15 mm long, lobes subequal to slightly shorter than the tube, membrane broad, flat to slightly wrinkled, but not carinate, pilose-puberulent; corolla with bright purple to pink lobes, the tube pale, 13–17 mm long, the lobes 7–12 mm long, obtuse, entire to emarginate or slightly retuse; stamens inserted on the upper tube and near the orifice; uppermost anthers slightly exserted; style 8.5–13 mm long, stigmas located in the upper tube or slightly exserted, among the upper stamens. **FRUIT** not observed. **SEEDS** not observed. Sparsely wooded slopes and roadsides; sagebrush, mountain brush, ponderosa pine, and spruce-fir communities. COLO: Arc, Hin, LPl; NMEX: RAr. 1980–2130 m (6500–7800'). Flowering: Apr–Jun. Fruit: May–Jun. Endemic to the Four Corners region.

Phlox cluteana A. Nelson **CP** (for William N. Clute, botanist) Perennial with 1–2 stems from long, slender rhizomes, forming colonies of scattered flowering and vegetative shoots. **STEMS** 8–15 (20) cm tall, the internodes elongate, the upper internodes often longer than the leaves, glabrous to glandular and short-villous. **LEAVES** linear, elliptic, or narrowly lanceolate, flat, acute to obtuse, glabrous to ciliate, sometimes glandular, 1–5 cm long, 2–5 mm wide, sparsely ciliate and pilose. **INFL** flowers 6–12, composed of 2- to 3-flowered cymes; pedicels glandular-pubescent, 8–18 mm long. **FLOWER** calyx 6–10 mm long, glandular-pubescent, the membranes flat; corolla pink to deep red-purple, the tube 15–17 (20) mm long, the lobes 8–10 mm long, rounded, emarginate or slightly retuse; stamens inserted on the upper tube and near the orifice; uppermost anthers slightly exserted; stigmas located in the upper tube among the stamens, sometimes slightly exserted. **FRUIT** subglobose to ovoid, apex obtuse, 3.2–4.2 mm long, 2.5–3.5 mm wide. **SEEDS** not observed. Open sites in sagebrush, ponderosa pine, and aspen communities. ARIZ: Apa, Coc; NMEX: SJn; UTAH. 1950–3140 m (6400–10300'). Flowering: (Apr) Jun–Jul. Fruit: Jun–Aug. South-central and southeast Utah and adjacent north-central and northeastern Arizona and northwestern New Mexico. A Four Corners regional endemic.

Phlox condensata (A. Gray) E. Nelson **CP** (condensed) Compact phlox. Densely pulvinate-caespitose, taprooted plants, forming cushion-mats or low mounds. **STEMS** numerous, short, erect, 1–4.5 (5) cm long, subparallel and discrete, internodes obscured by leaves. **LEAVES** linear to oblong, 4–9.5 mm long, 0.5–1.5 mm wide, erect and appressed, sharply bristle-pointed, thick and firm, 2-grooved along the back, hirsute-ciliate along the margins, at least below the middle, glandular-hairy or minutely granular-glandular to essentially glabrous on the surfaces. **INFL** flowers solitary and subsessile. **FLOWER** calyx 4–7.5 mm long, slightly to strongly glandular or glandular-puberulent to glandular-villous, intercostal membranes flat; corolla white to pink or blue-lavender, the tube 6–10 mm long, the lobes 3–5 mm; stamens inserted on the upper tube; style 1.5–3.2 mm long, shorter than or subequal to the lower stamen. Open, rocky places at high elevation, mostly in alpine tundra. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 2700–3700 m (9000–12200'). Flowering: Jul–Aug. Fruit: Aug–Sep.

Phlox diffusa Bentham (spreading) Spreading phlox, Sierra phlox. Caespitose and commonly mat-forming, taprooted perennial, occasionally looser. **STEMS** 5–10 cm tall. **LEAVES** green and pilose to glabrescent, with basally arachnoid-ciliate margins, 8–15 (20) mm long, (0.5) 1–2 mm wide. **INFL** flowers solitary to 3, subsessile, the pedicels 0.5–3 mm long, pilose to glabrescent, but eglandular. **FLOWER** calyx 7–11 mm long, commonly slightly arachnoid-villous; calyx lobes linear-subulate and often thickened; corolla white to pinkish or light bluish, the tube 9–17 mm long, less than twice as long as the calyx, the lobes 4.5–9 mm long, obovate; stamens inserted in the upper tube, style 3.5–7 mm long, subequal to the lower anthers. $2n = 28$. Forests and open, rocky slopes; ponderosa pine and Douglas-fir communities.

ARIZ: Apa. 1980–2590 m (6500–8500'). Flowering: May–Aug. Fruit: Jun–Aug (Sep). Cascade-Sierra Nevada ranges from southern British Columbia to southern California, extending east, less commonly, to Montana (west of the Continental Divide) and central Idaho, south to northwestern New Mexico and adjacent Colorado, and northern Arizona. Our material belongs to **subsp. *subcarinata*** Wherry (loosely spreading). *Phlox diffusa* subsp. *subcarinata* has recently been treated as conspecific with *P. austromontana* in regional floras. However, this taxon appears intermediate between *P. austromontana* and *P. diffusa*, showing some similarity to *P. canescens* in our area. Whether this represents a unique taxon or a widespread hybrid is not known, but without recognition, it is highly unlikely that this question will be investigated and resolved.

Phlox grayi Wooton & Standl. (for Asa Gray, botanist, 1810–1888) Erect to ascending, often suffrutescent, taprooted perennial. **STEMS** 3–8 (10), 8–18 (25) cm long, sometimes loosely clumped, the internodes evident, often 4, glandular and short-villous. **LEAVES** linear to oblong-ovate, 12–35 (40) mm long, 2–8 mm wide, pilose and ciliate. **INFL** flowers 3–12, composed of 2- to 3-flowered cymes; pedicels 8–50 mm, glandular to short-pilose. **FLOWER** calyx 7–12 mm long, the membranes carinate to ridged at the base; corolla purple to deep pink, less often white, the tube 12–18 mm long, the lobes 5–10 (12) mm long, obovate, obtuse; stamens inserted on the upper tube; stigmas located among the stamens. Gravelly slopes; piñon-juniper woodland and ponderosa pine communities. ARIZ: Nav; COLO: LPl, Mon; NMEX: McK, RAr, SJn. 1500–2280 m (5000–7500'). Flowering: Apr–Jun. Fruit: May–Jul. Historically and generally treated as conspecific with *P. longifolia* [*P. longifolia* var. *brevifolia*], differing in its short, broad, and stiff leaves. Expected throughout the study area; however, few populations correspond to this taxon.

Phlox longifolia Nutt. (long leaves) Erect to ascending, often suffrutescent, taprooted perennial. **STEMS** 3–8 (10), 9–30 (40) cm tall, sometimes loosely clumped, the internodes evident, glabrous to glandular and short-villous. **INFL** flowers 2–3, pedicels glandular to short-pilose. **FLOWER** calyx 7–12 (14) mm long, the membranes carinate to ridged at the base; corolla white to deep pink, the tube 12–30 mm long, the lobes 5–12 (15) mm long, obovate, obtuse; stamens inserted on the upper tube; stigmas located among the stamens. **FRUIT** globose, ovoid to obovoid, apex acute to obtuse, 3–6 mm long, 2–4.2 mm wide. **SEEDS** ovoid, somewhat irregular, dark brown, 2.2–3.6 mm long, 1–1.7 mm wide. [subspp. *calva* Wherry, *compacta* (A. Brand) Wherry, *cortezana* (A. Nelson) Wherry, *longipes* Wherry]. Sandy to rocky soils, open sites; sagebrush, desert scrub, piñon-juniper woodlands, ponderosa pine, aspen, and spruce-fir communities. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1125–2070 m (3700–6800'). Flowering: Apr–Jun. Fruit: May–Jul. British Columbia to Montana, south to eastern California and New Mexico. Geographic and ecological variation with respect to habit, leaf size, vesture, and floral morphology is complex throughout the range of the species and in much need of thorough investigation. In Wherry's monographic study, two species (one glandular, the other eglandular) and several subspecies were recognized within what is here referred to as *P. longifolia*.

Phlox multiflora A. Nelson (many flowers) Rocky Mountain phlox. Loosely matted, taprooted perennials. **STEMS** numerous, short, suberect, rarely rising as much as 5–10 (15) cm tall. **LEAVES** linear, thin, (10) 12–30 mm long and 1–2 mm wide, slightly ciliate, inconspicuously granular-scaberulous to virtually glabrous. **INFL** flowers 1–3 at the ends of the stems, sessile to short-pedicelled. **FLOWER** calyx glabrous or seldom inconspicuously tomentose, the intercostal membranes flat, the lobes rather narrow and often thickened, but not firm; corolla white to sometimes pink or bluish, the tube 10–14 mm long, the limb relatively large, with lobes 6–11 mm long; filaments inserted in the upper tube, style 5.5–8 (10) mm long, the same height as the anthers. [*P. multiflora* subsp. *depressa* (E. Nelson) Wherry; *P. multiflora* subsp. *patula* (A. Nelson) Wherry]. Open or wooded, often rocky places, from the higher foothills to above timberline; sagebrush, ponderosa pine, and Douglas-fir communities. COLO: Arc, Hin, LPl, Min, Mon, SJn. 2200–3265 m (7215–10710'). Flowering: Jun–Aug. Fruit: Jul–Aug (Sep). Idaho and western Montana, south to northeastern Nevada and northern Utah, Wyoming, Colorado, and north-central New Mexico

Phlox nana Nutt. (dwarf) Canyon phlox. Erect to ascending, often clumped, taprooted perennial. **STEMS** 10–25 (30), 10–30 (35) cm tall, the internodes evident but shorter than the leaves. **LEAVES** 25–45 mm long, 2–5 mm wide, linear, narrowly elliptic to lanceolate, sparsely to moderately glandular-pubescent. **INFL** 2–6 (15) flowers, composed of 2- to 3-flowered cymes, pedicels 3–30 mm long, densely glandular-pubescent. **FLOWER** calyx 8–17 mm long, the intercostal membranes narrow and flat; corolla purple, lilac to deep pink, or white, rarely yellow, the tube 12–18 mm long, the lobes 9–15 mm long, 8–10 mm wide, orbicular to obovate; stamens inserted in the middle to lower tube; style short, stigmatic lobes subequal to the stamens. Mountain meadows and slopes and piñon-juniper woodland communities. NMEX: RAr. 1525–2500 m (5000–8200'). Flowering: May–Aug. Fruit: Jun–Sep. New Mexico, southeastern Arizona, Trans-Pecos Texas, and Mexico.

Phlox pulvinata (Wherry) Cronq. (cushion-shaped) Cushion phlox. Caespitose, loosely to densely matted or low-mounded, taprooted perennials. **STEMS** 2.5–5 (12) cm long, tending to spread out along the substrate, sometimes also spreading belowground, the internodes short, obscured by the leaves. **LEAVES** crowded, rather firm, mostly 5–12 (15) mm long and 1–2.5 mm wide, erect but arcuate and spreading, the surfaces glabrous to often glandular or hairy, the margins slightly thickened, usually ciliate toward the base. **INFL** flowers solitary (to 3), sessile or short-pedicelled, the pedicels glandular-pubescent. **FLOWER** calyx 6–11 mm long, usually glandular-hairy, occasionally eglandular or even glabrous, the intercostal membranes flat, the lobes flattened, with inconspicuous midvein; corolla white or light bluish, the tube 8–13 mm long, up to twice as long as the calyx, the lobes 4–7 mm long, obovate, obtuse; stamens inserted from midtube to the upper tube; style 2–5 mm long. Open, rocky places, clay slopes, meadows, mountain slopes; spruce-fir, krummholz, subalpine, and alpine meadows. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr. 3500–3700 m (11500–12200'). Flowering: Jul–Aug. Fruit: Aug–Sep. Southwestern Montana to north-central New Mexico, west to northeastern Oregon and the Sierra Nevada of California.

Phlox standsburyi (Torr.) Heller. (for Howard Standsbury, 1806–1863) Erect to ascending, often suffrutescent, taprooted perennial. **STEMS** 9–14 (20) cm tall, sometimes loosely clumped, the internodes evident, glandular and puberulent to short-villous. **LEAVES** linear to oblong-lanceolate, 35–82 mm long, 3–6 mm wide, puberulent and glandular. **INFL** 3- to 21-flowered, composed of 2- to 3-flowered cymes, pedicels 5–25 mm, glandular-pubescent. **FLOWER** calyx 7–14 mm long, the membranes carinate to plicate; corolla white to deep pink, the tube 19–25 mm long, the lobes 7–12 (15) mm long, narrowly obovate, obtuse; stamens inserted on the upper tube; stigmas located among the stamens. Sandy to rocky soils, open sites; sagebrush, desert scrub, piñon-juniper woodland, ponderosa pine, aspen, and spruce-fir communities. ARIZ: Nav; UTAH. 1200–1900 m (4000–6000'). Flowering: Apr–Jun. Fruit: May–July. British Columbia to Montana, south to eastern California and New Mexico. The Ramah Navajo made a decoction of leaves that was taken during menstruation as a contraceptive. The leaves were used as a lotion for sores. The Hopi used an infusion to keep grasshoppers, rabbits, and pack rats from eating corn.

Phlox woodhousii (Torr. ex A. Gray) E. E. Nelson (for S. W. Woodhouse, horticulturist, physician) Perennial. **STEMS** 1–4 from a deep-seated, creeping rhizome, sometimes suffrutescent; 6–15 cm tall, the lower internodes evident. **LEAVES** linear-oblong to narrowly lanceolate, flat, acute to obtuse, glandular and short-villous, 1.5–4 cm long, 3–5 mm wide. **INFL** flowers 2–3, pedicels glandular, short-villous. **FLOWER** calyx 7–9 mm long, the membrane flat; corolla usually bright pink, the tube 10–15 mm long, the lobes 6–10 mm long, retuse to emarginate; stamens subequally inserted on the middle tube; style short, 1–2.5 mm long, stigmas located well below the stamens. [var. *oculata* A. Nelson]. Open sites, rocky slopes; ponderosa pine communities. ARIZ: Apa. 1200–2450 m (4000–8000'). Flowering: May–Jul (Aug). Fruit: Jun–Aug. Central Arizona to northwest New Mexico.

Polemonium L. Jacob's Ladder, Sky Pilot

(origin ambiguous: possibly honoring Polemon, Greek philosopher, perhaps Greek *polemos*, strife) Perennial herbs (in our area), one annual. **STEMS** erect to decumbent. **LEAVES** alternate, pinnately lobed to compound; leaflets sessile, entire or divided into 2–5 lobes. **INFL** terminal, open to compact and capitate or rarely axillary and then solitary. **FLOWERS** actinomorphic; calyx herbaceous, becoming membranous, not ruptured in fruit, the lobes rounded to attenuate; corolla rotate to funnelform or salverform, white, yellow, blue, or bluish violet; stamens equally inserted on the corolla tube; filaments equal in length, basally pilose; anthers included to exserted; style included to exserted, with 3 stigmatic branches. **CAPSULES** globose to ovoid, dehiscent; seeds 1–20 per locule, gelatinous or not when wet. $2n = 18, 36$. About 28 species. Western North America, one species in southern South America, and several in Eurasia (Davidson 1950; Grant 1989). Recent population genetics studies indicate that species boundaries of the tufted, alpine polemoniums are far more complex than previously imagined. However, no taxonomic changes have been proposed to date.

1. Corolla campanulate or broader, about as wide as long, or wider, the lobes from a little shorter than to about twice as long as the tube; leaflets opposite or offset, ordinarily undivided and not appearing verticillate; plants of various habit and habitat, glandular and mephitic, but not strongly so.....(2)

1' Corolla funnelform or tubular-funnelform to subsalverform, distinctly longer than wide, the lobes distinctly shorter than the tube; leaflets, or many of them, so deeply 2- to 5-cleft as to appear verticillate; plants small, up to 30 cm tall, mostly alpine and subalpine, very strongly glandular and mephitic, with numerous stems from a taproot and much-branched, sometimes elongate caudex.....(4)

2. Rhizomatous, the rhizomes simple, upturned distally, stem solitary, erect, (15) 38–100 cm tall; styles exserted, twice as long as anthers; plants of very wet places ..... ***P. occidentale***
2' Caudex present, branched, mostly clustered, rarely solitary, sometimes elongate and somewhat rhizomelike; styles included, plants of moist to dry, often rocky places ..... (3)

3. Plants relatively large and coarse, (30) 40–120 cm tall, leafy throughout, lacking a tuft of basal leaves ..... ***P. foliosissimum***
3' Plants relatively small and compact, 5–20 (25) cm tall, leafy chiefly toward the base, often with tufted basal leaves ..... ***P. pulcherrimum***

4. Flowers ochroleucous to pale yellow; leaflets tending to be rather remote, often many of them undivided; inflorescence loose and somewhat elongate ..... ***P. brandegei***
4' Flowers blue-violet (very rarely white); leaflets crowded, most or all of them deeply 2- to 5-cleft; inflorescence dense and compact, fan-shaped to globose ..... (5)

5. Corolla broadly funnelform, mostly 17–26 mm long, 10–15 mm wide, pale blue; inflorescence globose ..... ***P. confertum***
5' Corolla narrowly funnelform, mostly 15–30 mm long, 5–10 mm wide, deep blue-violet; inflorescence fan-shaped ..... ***P. viscosum***

Polemonium brandegei (A. Gray) Greene (for Townshend S. Brandegee, botanist, 1843–1925) Pale sky pilot. Low herbaceous perennial with a stout taproot and branched caudex, 8–24 (32) cm tall. **LEAVES** generally basal, 1.7–20 cm long, densely stipitate-glandular or glandular-villous and strongly mephitic; leaflets numerous, crowded, mostly or all 2- to 3-cleft to the base, appearing verticillate, the individual segments 4–10 (12) mm long and 1–4 mm wide, fairly well spaced. **INFL** loosely cymose-capitate or spicate, usually elongating a little in fruit. **FLOWER** calyx 7–12 mm long, lobes acuminate, shorter than the tube, densely glandular-villous; corolla ochroleucous, cream-colored to pale yellow, narrowly funnelform or tubular-funnelform, mostly 21–31 mm long, longer than wide, throat 5–8.5 mm wide; stamens distinctly equaling the corolla lobes; style exserted, longer than the stamens. **FRUIT** a capsule, 3.8–5.5 mm long, 2.8–3.2 mm wide, ovoidal to subglobose. **SEEDS** 1.8–3.1 mm long, 0.7–1.2 mm wide, obovoid, angular, winged at one end, dark reddish brown, not becoming mucilaginous when wetted, (1) 3–5 per locule. $2n = 18$. [*P. viscosum* Nutt. subsp. *mellitum* (A. Gray) Davidson]. Alpine scree, rock slides, and crevices. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 3050–4115 m (10000–13500'). Flowering: Jun–Aug. Fruit: Aug–Sep. Wyoming and western South Dakota, south to northern Utah; the Tushar Mountains, near Marysvale, Utah; Colorado; and northern New Mexico. Similar to *P. viscosum*, but leaflets longer, less crowded, frequently offset, and many of them undivided. The inflorescence is also longer, looser, more thyrsoid or almost racemose or spicate, and the flowers are ochroleucous to yellow.

Polemonium confertum A. Gray (densely crowded) Gray's sky pilot. Low herbaceous perennial with a taproot and branched caudex, 7–26 cm tall. **LEAVES** mostly basal, up to 20–40 cm long; densely stipitate-glandular or glandular-villous, and strongly mephitic, leaflets numerous, crowded, mostly 2- to 3-cleft, appearing verticillate, the individual segments 4–10 mm long and 2–4 mm wide. **INFL** densely cymose-capitate, usually elongating a little in fruit. **FLOWER** calyx 7–12 mm long at anthesis, the narrow, acute lobes shorter than the tube; corolla blue-violet, more or less funnelform or tubular-funnelform, mostly 17–26 mm long, longer than wide, often very conspicuously so, 10–15 mm wide at the orifice, the lobes shorter than the tube; stamens distinctly shorter than to sometimes nearly equaling the corolla lobes, anthers (pollen) orange-yellow; style exserted beyond the anthers. **FRUIT** a capsule, 3.8–5.5 mm long, 2.8–3.2 mm wide, ovoidal to subglobose. **SEEDS** 1.8–3.1 mm long, 0.7–1.2 mm wide, obovoid, angular, winged at one end, dark reddish brown, not becoming mucilaginous when wetted. Alpine scree slopes. COLO: Arc, Con, Hin, Min, SJn. 3350–3720 m (11000–12200'). Flowering: Jun–Aug. Fruit: Aug–Sep. Rocky Mountains of central Colorado, barely extending into our study area.

Polemonium foliosissimum A. Gray (many leaves) Leafy Jacob's ladder. Perennial herbs with 1–5 leafy stems, 20–90 (110) cm tall, glabrous, pilose, or villous. **LEAVES** 3–10 cm long, 0.8–2 cm wide, glabrous to sparsely glandular, little reduced; leaflets 11–27, lanceolate to elliptic, ovate to narrowly lanceolate, 5–25 (35) mm long, 5–7 (10) mm wide, the terminal (3) 5 leaflets confluent. **INFL** cymose, open to congested, often branched, short, wide, flat-topped corymb. **FLOWER** pedicels 2–8 mm long; calyx 5–8 (10) mm long, the tube and lobes equal in length, glandular-pubescent; corollas bluish violet to lavender, campanulate, 10–15 mm long, the lobes rounded to elliptic, acute, nearly twice as long as the tube; anthers exserted, but shorter than the corolla lobes; style exserted, usually exceeding the stamens.

FRUIT a capsule, (2.5) 4–6 mm long, (2) 3.7–4.3 mm wide, globose to ovoid. **SEEDS** 2–2.5 mm long, 0.8–1 mm wide, (1) 3–5 per locule, oblong-ovoid, angular, dark brown, often with a partial wing, becoming mucilaginous when wetted. [*P. foliosissimum* subsp. *molle* (Greene) Wherry]. Our material belongs to **subsp. *foliosissimum***. Wooded areas, brushy slopes, streamsides, and mountain meadows in aspen, spruce-fir forests, Douglas-fir, and oak woodland communities. COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; NMEX: RAr; UTAH. (1520) 2130–3350 m [(5000) 7000–11000']. Flowering: (May) Jun–Aug. Fruit: Jul–Aug. Nevada and Idaho, east to Colorado, and south to Arizona and western New Mexico.

Polemonium occidentale Greene (western) Western Jacob's ladder. Herbaceous perennial. **STEMS** solitary from a fairly short and simple, horizontal rhizome, (15) 40–100 cm tall, glandular-villous. **LEAVES** both basal and lower cauline, well developed and rather long-petiolate, 3–25 cm long, with 9–27 lanceolate to elliptic and acute leaflets, (5) 10–40 mm long and (0.5) 2–13 mm wide, the 3 terminal ones often confluent; middle and upper leaves more or less reduced. **INFL** strongly glandular-villous, an elongate and narrow panicle or thyrse, flowers typically crowded. **FLOWER** calyx 5–8 mm long, the lobes equaling or commonly a little shorter than the tube, glandular-puberulent; corolla mostly sky-blue or nearly so (rarely white), 10–16 mm long, the lobes rounded to elliptic, twice as long as the tube; stamens usually about equal to or shorter than the corolla lobes; style generally exserted and conspicuously surpassing the stamens. **FRUIT** a capsule, 3–6 mm long, 2–4 mm wide, globose to ovoid. **SEEDS** 2–3 mm long, 0.7–1 mm wide, obovoid, angular, winged at one end, dark reddish brown, not becoming mucilaginous when wetted. $2n$ = 18. [*P. caeruleum* L. subsp. *amygdalinum* (Wherry) Munz]. Our material belongs to **subsp. *amygdalinum*** Wherry. At middle elevations in the mountains, occasionally in the foothills or near timberline, swamps, mossy subalpine birch-willow bogs, stream edges. COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn. 1830–3100 m (6000–10200'). Flowering: Jun–Aug. Fruit: Jul–Aug. From Yukon and eastern Alaska to California, Nevada, Utah, and Colorado, also rarely in northern Minnesota. Most frequently confused with *P. foliosissimum*; however, the two species are distinguished as follows: *P. foliosissimum* has a short, wide, flat-topped inflorescence; purple flowers; style subequal to or slightly longer than the corolla lobes; plant from rhizomes. *Polemonium occidentale* has a long and narrow inflorescence; blue flowers; style much longer than the corolla lobes; and the plants are from a woody caudex.

Polemonium pulcherrimum Hook. (beautiful) Short Jacob's ladder, pretty Jacob's ladder. Perennial herbs with several stems, 10–25 cm tall, glabrous to sparsely pilose-glandular, from a subrhizomatous caudex. **LEAVES** few per stem, mostly 5–14 cm long, villous to glandular-pilose; leaflets 17–25, ovate to elliptic, 5–15 mm long, 3–7 mm wide, the 3 terminal confluent. **INFL** congested to open and elongate, a corymb. **FLOWER** pedicels 1–8 mm long; calyx tube 4–7 mm long, the lobes lanceolate to ovate, 2–3 mm long, mostly longer than the tube; corollas blue-violet, with a yellow or white throat, rotate, 8–14 mm long, the tube 2–5 mm long, the lobes obovate; anthers slightly exserted, subequal to the corolla lobes; style included to slightly exserted, usually equaling the stamens. **FRUIT** a capsule, 2.5–3.2 mm long, 1.3–1.8 mm wide. **SEEDS** 1–3 per locule, 1.3–2.2 mm long, 0.6–1.2 mm wide, pyriform, ovoid, obovoid, or lenticular, often acute at one end, reddish brown, not becoming mucilaginous when wetted. $2n$ = 18. [*P. delicatum* Rydb.]. Three subspecies, Alaska south to Arizona and New Mexico. In our area, only **subsp. *delicatum*** (Rydb.) A. Brand (addicted to pleasure, dainty) is represented. Shaded forest floors, aspen, spruce-fir communities. ARIZ: Apa, Nav; COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NMEX: RAr; UTAH. 2315–3510 m (7600–12500'). Flowering: Jun–Aug. Fruit: Jul–Sep. Eastern Nevada to Wyoming, south to Arizona and New Mexico.

Polemonium viscosum Nutt. (viscous, glutinous) Sky pilot. Low herbaceous perennial with a stout taproot and branched caudex, 6–24 (30) cm tall. **LEAVES** generally basal, 1.7–15 (25) cm long, densely stipitate-glandular or glandular-villous and strongly mephitic; leaflets numerous, crowded, mostly or all 2- to 5-cleft to the base, appearing verticillate, the individual segments 1.5–6 (9) mm long and 1–3 mm wide. **INFL** cymose-capitate and fan-shaped, usually elongating a little in fruit. **FLOWER** calyx 7–12 mm long, lobes acuminate, shorter than the tube; corolla blue-violet, narrowly funnelform or tubular-funnelform, mostly 11–28 (30) mm long, longer than wide, throat 6–10 mm wide; stamens distinctly shorter than to sometimes nearly equaling the corolla. **FRUIT** a capsule, 3.8–5.5 mm long, 2.8–3.2 mm wide, ovoid to subglobose. **SEEDS** 1.8–3.1 mm long, 0.7–1.2 mm wide, obovoid, angular, winged at one end, dark reddish brown, not becoming mucilaginous when wetted, (1) 3–5 per locule. $2n$ = 18. Stable alpine tundra, rocky meadows. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 3050–4010 m (11200–13200'). Flowering: Jun–Aug. Fruit: Jul–Sep. Rocky Mountain region, from southwestern Alberta to northern New Mexico, west to Okanogan County, Washington, eastern Oregon, and the mountains of central Nevada and northern Arizona.

POLYGALACEAE R. Br. MILKWORT FAMILY

Tom Wendt

Annual herbs, trees, lianas, achlorophyllous herbs or (in ours) shrubs, subshrubs, and perennial herbs. **LEAVES** simple, alternate (in ours), verticillate, or opposite; margin entire (in ours) or lightly denticulate; stipules absent. **INFL** a bracteate raceme (in ours), spike, or panicle. **FLOWERS** perfect, zygomorphic, often (in ours) papilionoid (appearing like a pea flower) in aspect but not in structural detail; sepals 5, free in ours, the 2 lateral (internal) pairs frequently much larger and petaloid ("wings"); petals 3 (in ours) or 5, distinct from each other but adnate to the staminal tube, often (in ours) differentiated into a lower keel petal and 2 straplike upper petals; stamens 3–10 (most frequently 8), usually united at least at the base, forming a tube open on the upper side, the anthers usually dehiscing by a longitudinal slit that is most often (in ours) reduced to a short apical porelike slit; intrastaminal annual disc often present, often reduced to an adaxial gland; ovary superior, 1–8-locular (2 in ours), each locule with 1 ovule (apically attached in ours), style 1. **FRUIT** a loculicidal capsule (in ours), drupe, samara, or nut. **SEEDS** 1 per locule. $x = 5–11+$ (Blake 1924). About 18 genera and 800 species. Mostly tropical and subtropical, with *Polygala* reasonably well represented also in temperate areas. The family can be diverse locally, and many species have attractive flowers, but the family is rarely of economic or ecological importance. It is uncommon in our area and represented only by the largest genus, *Polygala*.

Polygala L. Milkwort

(Greek *polys*, much, + *gala*, milk, for purported increase in lactation caused by a European species) **FLOWERS** papilionoid in aspect; lateral (inner) sepals enlarged as wings; lower (abaxial) petal differentiated as a keel which typically has a straplike base adnate to the staminal column and a distal pouchlike part, this latter frequently apically appendaged or ornamented, the 2 upper (adaxial) petals straplike and distally more or less reflexed; stamens 6–8 (8 in ours); ovary 2-locular, style with 2 dissimilar lobes distally. **FRUIT** a bilocular, loculicidally dehiscent, usually flattened capsule. **SEEDS** fusiform to ovoid, usually hairy and with a 2-lobed white aril, the testa black. A genus of about 500 species, cosmopolitan except for New Zealand and Polynesia (where introduced), and high latitudes. Represented in our area by three more or less thorny shrubs and subshrubs. A fourth species, *Polygala alba* Nutt. (white milkwort), a perennial herb, is known from just outside our area in McKinley County, New Mexico, and is included in the key.

1. Perennial herb, unarmed; wings 2–3.5 mm long, white; keel distally ornamented with a finely many-lobed fimbriate crest; inflorescence a dense conical raceme of many more than 15 flowers and buds. (Suspected but not documented for the study area) ..... *P. alba*

1′ Shrub, subshrub, or suffrutescent perennial, thorny (sometimes weakly so); wings (outer sepals) 2.5–12 mm long, cream-colored or rose; keel distally unornamented or with an undivided cylindrical fingerlike beak; inflorescence few-flowered, rarely with more than 15 flowers and buds, lax or dense, thorn-tipped, never with an elongate regular conical aspect ..... (2)

2. Wings 7 mm or more in length, rose or pink; young twigs minutely puberulent with erect hairs distinctly less than 0.1 mm long, to subglabrous ..... ***P. subspinosa***

2′ Wings 5 mm or less in length, cream-colored; young twigs densely pilose to tomentose with hairs distinctly longer than 0.1 mm ..... (3)

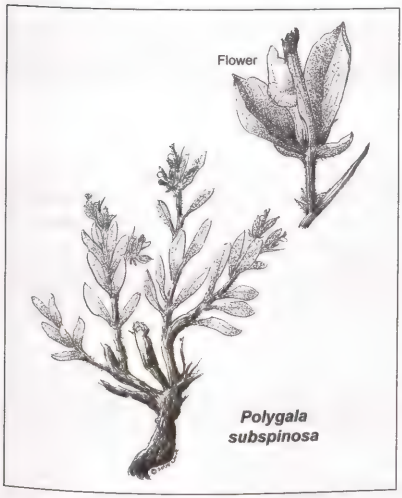
3. Leaves and branchlets densely beset with short spreading hairs; pedicel and abaxial surface of outer sepals with spreading hairs ..... ***P. acanthoclada***

3′ Leaves with incurved hairs, branchlets with dense matted or shaggy tomentum of appressed, incurved, or occasionally inclined or divergent hairs; pedicel glabrous; outer sepals glabrous or only ciliate, occasionally with a few incurved hairs distally ..... ***P. intermontana***

Polygala acanthoclada A. Gray (thorn-branched) Desert polygala. Subshrub or shrub to 1 m, usually 15–70 cm tall, sometimes erect but usually low, unkempt, spreading and often semirhizomatous; twigs with dense, short, spreading pubescence, tip eventually becoming a thorn-tipped raceme. **LEAVES** oblanceolate or narrowly elliptic to narrowly obovate, 5–25 mm long, 1–5 mm wide, with spreading hairs on both surfaces, sessile or nearly so. **INFL** a terminal raceme on a branchlet, loosely to densely (1) 2–15-flowered, up to 2.5 cm long, or flowers fasciculate; pedicels mostly 1.5–5 mm. **FLOWERS** 3–5.3 mm long; outer sepals ovate to elliptic, 1.6–3.5 mm long; wings obovate, 3–5 mm long, cream-colored; free portion of upper petals 1.8–3 mm long, cream-colored, the bifid tips usually with rose markings;

keel 2.7–3.8 mm long (including the adnate base), beakless or with a minute beak up to 0.7 mm. **CAPSULES** oval or elliptic or slightly obovate, emarginate, 4–6 mm long, when ripe the walls slightly succulent, more or less translucent, prominently veined, glabrous. **SEEDS** (including aril and hairs) 3.2–4.2 mm long; testa evenly to unevenly hairy; aril 1–1.7 mm long. $n = 9$. Mostly on sandy soils near washes in desert shrubland, locally common but very restricted in range in our area to the Clay Hills/Paiute Farms area of the lower San Juan River drainage. UTAH. 1100–1500 m (3600–4900′). Flowering: May–Oct. Southern California and west-central Arizona northeastward along the Colorado River drainage into southeastern Utah. See comments under *P. intermontana*.

Polygala intermontana T. Wendt (referring to the Intermountain region) Great Basin polygala. Intricately branched shrub to 1 m, spreading to 1.4 m across; twigs with white tomentum of densely matted or shaggy, appressed, incurved, or occasionally irregularly inclined or divergent hairs, tips eventually becoming thorn-tipped racemes. **LEAVES** oblanceolate or linear to obovate, 3–25 mm long, 0.8–3.5 mm wide, with incurved hairs on both surfaces, sessile or nearly so. **INFL** a terminal raceme on branchlets, loosely to densely 1–7-flowered, to 1.5 cm long, or flowers fasciculate; pedicels mostly 3–7 mm. **FLOWERS** 2.5–5.2 mm long; outer sepals ovate to elliptic or narrowly so, 1.3–3.3 mm long; wings obovate, 2.5–4.9 mm long, cream-colored; free portion of upper petals 1.5–2.7 mm long, cream-colored, the bifid tips usually with rose markings; keel 2–3.4 mm long (including the adnate base), beakless or with a minute beak up to 0.5 mm. **CAPSULES** oval or ovate to nearly orbicular, emarginate, 4–6 mm long, when ripe the walls slightly succulent, more or less translucent, prominently veined, glabrous. **SEEDS** (including aril and hairs) 2.8–4.2 mm long; testa sparsely hairy to nearly glabrous; aril 1.2–2.3 mm long. $n = 9$. [*P. acanthoclada* A. Gray var. *intricata* Eastw.]. Sandy soils to rimrock, desert scrub to piñon-juniper, restricted in our area to the lower San Juan River drainage and the Monument Valley region. ARIZ: Nav; UTAH. 1400–1900 m (4600–6200′). Flowering: May–Sept. Mountains of west-central Nevada and adjacent California, eastward through the Great Basin to southeastern Utah and northern Arizona. Our area is essentially the only region in which the ranges of this species and the closely related, more southern *P. acanthoclada* overlap. A few populations in the Clay Hills area display stages of morphological intermediacy between these two species. While both species are diploid ($n = 9$) with regular meiosis, the intermediate populations are tetraploid ($n = 18$) and display irregular meiosis and are thus best considered to be hybrids rather than intergrading populations, supporting the specific status of the two species (Wendt 1978).



Polygala subspinosa S. Watson **CP** (somewhat spiny) Spiny polygala. Suffrutescent perennial or subshrub to 15 (–25) cm tall or infrequently a shrub to 60 cm, occasionally subrhizomatous; twigs glabrous or puberulent with spreading or slightly incurved hairs, tips eventually becoming a thorn-tipped raceme. **LEAVES** oblanceolate to obovate or elliptic, 4–31 mm long, 2–11 mm wide, puberulent with spreading hairs to subglabrous. **INFL** a terminal raceme on branchlets, loosely 1–8 (–30)-flowered, to 4 (12.5) cm long; pedicels mostly 3–10 mm. **FLOWERS** (6–) 8–13 mm long; outer sepals ovate or elliptic-lanceolate, 2–7.2 mm long; wings obovate, (5–) 7–12 mm long, rose or rose-pink; free portion of upper petals 3–6.6 mm long, silvery rose to mottled rose and white, the usually bifid tips dark rose; keel 5.5–10.5 mm long (including the adnate base), with a rather prominent flattened-cylindrical apical yellow beak 1–3 mm long. **CAPSULES** with short stipe 0.1–1.6 mm long, above the stipe elliptic or obovate, distally rounded to emarginate, 5.5–10 mm long (including stipe), wall opaque and not succulent, prominently veined, glabrous or puberulent. **SEEDS** (including aril and hairs) 3.3–4.9 mm long; testa more or less evenly hairy; aril 1.2–3.1 mm long. $n = 9, 18$. Usually in loose, rocky to sandy soils, breaks, and outcrops in shrubland and open piñon-juniper woodland. COLO: LPl, Mon; NMEX: SJn; UTAH. 1500–2400 m (4900–7800′). Flowering: Apr–Jul. Northwestern California, Nevada, Utah, western Colorado, northwestern New Mexico, and northern Arizona. This is a smaller, less shrubby species than the other two in our area, often having short herbaceous stems arising from a stout rootstock, and is thus frequently less obviously thorny.

POLYGONACEAE Juss. KNOTWEED FAMILY

James L. Reveal

Shrubs, subshrubs, or herbs, occasionally trees and vines, annual, biennial, or polycarpic (rarely monocarpic) perennial. **STEMS** prostrate to erect, sometimes scandent or scapose, solid or hollow, glabrous or variously pubescent, sometimes glandular; nodes smooth (subfam. Eriogonoideae) or swollen (subfam. Polygonoideae). **LEAVES** deciduous or persistent, estipulate (subfam. Eriogonoideae) or stipulate (having fused stipules called ocreae; subfam. Polygonoideae), these persistent or deciduous, cylindric or funnelform, entire or 2-lobed, chartaceous, membranous, coriaceous, or foliaceous; petioles present or absent; blades basal or basal and cauline, occasionally merely cauline, rosulate, alternate, opposite, or whorled, simple, usually entire. **INFL** cymose, paniculate, racemose, spicate, umbellate, or capitate; bracts scalelike to foliaceous (subfam. Eriogonoideae) or absent (subfam. Polygonoideae); peduncles present or absent; cluster of flowers subtended by 1–several involucral lobes or enclosed in a nonmembranous tube of fused lobes (involucre; subfam. Eriogonoideae), or subtended by fused bracteoles forming a membranous tube (ocreolae; subfam. Polygonoideae). **FLOWERS** actinomophic, hypogynous, imperfect, 1–many, pedicellate, sometimes stipitate, usually bisexual, occasionally bisexual and unisexual on the same or different plant, rarely unisexual only; tepals petaloid or sepaloid, rarely coriaceous, 2–6, distinct or connate proximally and forming a tube, usually in 2 whorls, dimorphic or monomorphic; nectary a disc at base of ovary or glands at base of filaments; stamens (1) 6–9; filaments distinct or connate proximally; anthers dehiscing by longitudinal slits; pistil (1) 2–3 (4)-carpellate; ovary superior, 1-locular; ovules 1; styles 1–3, distinct or proximally connate; stigmas 1 per style, usually capitate, occasionally fimbriate, peltate, or penicillate. **FRUIT** an achene, trigonous or less often lenticular, rarely quadrangular, winged or unwinged; seed 1; endosperm abundant, mealy; embryo straight or curved (Brandbyge 1993; Freeman and Reveal 2005; Graham and Wood 1965; Lamb Frye and Kron 2003; Reveal 1978; Roberty and Vautier 1964; Ronse Decraene and Akeroyd 1988). Forty-eight genera, about 1200 species. Worldwide. Many important weed species belong to this family. *Fagopyrum* is the source of buckwheat; seeds of *Coccoloba* (seaside grape) are eaten in the tropics. *Rheum* (rhubarb) is an important medicinal in eastern Asia; its petioles are edible. The cultivated ornamental *Antigonon* (coral vine) may be seen in warm, protected sites. The traditional, broad definition of *Polygonum* is abandoned here in favor of recognizing smaller, monophyletic genera.

1. Ocreae absent; nodes not swollen; flowers enclosed in nonmembranous involucres (subfam. Eriogonoideae Arn.) ..... (2)
1′ Ocreae present, persistent or deciduous; nodes usually swollen; flowers enclosed in membranous ocreolae (subfam. Polygonoideae Arn.) ..... (5)

2. Involucral structure not awn-tipped ..... (3)
2′ Involucral structure awn-tipped ..... (4)

3. Involucral structure tubular ..... ***Eriogonum***
3′ Involucral structure of 2 whorls of 3 involucral lobes ..... ***Stenogonum***

4. Involucre with awns at both distal and proximal ends of involucral tube ..... ***Centrostegia***
4′ Involucre with awns only at distal end of involucral tube ..... ***Chorizanthe***

5. Tepals 6; stamens 6 ..... ***Rumex***
5′ Tepals 4 or 5; stamens (2) 3–8 ..... (6)

6. Tepals 4; achenes winged, lenticular; leaves basal ..... ***Oxyria***
6′ Tepals 4 or 5; achenes not winged, trigonous, lenticular, or sometimes biconvex; leaves cauline or basal and cauline ..... (7)

7. Leaves mostly basal, some cauline; inflorescence spicate; flowering stems unbranched ..... ***Bistorta***
7′ Leaves cauline; inflorescences terminal or axillary; stems usually branched ..... (8)

8. Stems scandent or sprawling vines; leaf blades cordate-ovate, cordate-hastate, or sagittate; flowers stipitate proximally ..... ***Fallopia***
8′ Stems prostrate to erect, not scandent or sprawling vines; leaf blades linear to nearly round, not hastate or sagittate; flowers not stipitate proximally ..... (9)

9. Ocreae chartaceous, usually tan, brown, or red, glabrous or scabrous to variously pubescent, not 2-lobed distally, tearing but not fibrous with age ..... ***Persicaria***
9' Ocreae often hyaline, silvery, glabrous, 2-lobed distally, often becoming fibrous with age ..... ***Polygonum***

Bistorta (L.) Scop. Bistort

Rodney Myatt

(Latin *bis*, twice, + *tortus*, a twist, alluding to the knotty rhizomes of some species) Plants perennial herbs; rhizomes often contorted. **STEMS** erect, glabrous; flowering stems unbranched. **LEAVES** mostly basal, some cauline, alternate, sometimes petiolate; ocrea persistent or disintegrating with age, chartaceous entirely or distally; blades linear-lanceolate or narrowly elliptic to ovate. **INFL** terminal, spikelike; peduncle slender, ascending or spreading. **FLOWERS** bisexual, 1–2 per ocreate fascicle, not stipitate proximally, pedicellate; perianth nonaccrescent, white, greenish, pink, red, or purple, glabrous; tepals 5, petaloid, connate 1/5 their length, monomorphic or slightly dimorphic; stamens 5–8; filaments distinct or connate proximally; styles 3, erect or spreading, distinct or connate proximally; stigmas capitate. **ACHENES** trigonous, brown to dark brown, not winged, glabrous; embryo curved. $x = 11, 12$ (Freeman and Hinds 2005). About 50 species of Arctic and temperate North America (four species) and Eurasia.

1. Racemes short-cylindric to ovoid, (8) 12–25 mm wide, without bulblets; flowers white or pinkish ..... ***B. bistortoides***
1' Racemes narrowly elongate-cylindric, 4–8 (10) mm wide, bearing pyriform, pink to brown or purple bulblets in place of some of the lower flowers; flowers greenish, rarely red ..... ***B. vivipara***

Bistorta bistortoides (Pursh) Small (similar to *Polygonum bistorta* of the Old World) American bistort. Plants (10) 20–60 (75) cm tall; rhizomes contorted. **LEAVES** basal and cauline; ocrea brown, 9–25 (32) mm long, glabrous; petiole attached to sheath, 1–3.5 (5) cm long, wingless, absent on distal cauline blades; basal blade linear to linear-lanceolate to elliptic, (3) 5–20 (22) cm long, (0.5) 0.8–3.5 (4.8) cm wide, not revolute, glabrous or pubescent and glaucous abaxially, glabrous adaxially; cauline blade linear-lanceolate to lanceolate or elliptic. **INFL** short-cylindric to ovoid, (1) 2–4 (5) cm long, (0.8) 1.2–2.5 cm wide; peduncle 1–10 cm long. **FLOWERS** 1–2 per ocreate fascicle; pedicel 2–8 (11) mm long; perianth white or pale pink, 4–5 mm long; tepals oblong; bulblets absent; stamens exserted; anthers yellow. **ACHENES** yellowish brown to olive-brown, 3–4 mm, shiny, smooth. $n = 12$. [*Polygonum bistortoides* Pursh; *Persicaria bistortoides* (Pursh) H. R. Hinds]. Moist flats and slopes in subalpine and alpine meadows or along stream and lakesides. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; UTAH. 2745–3810 m (9000–12500'). Flowering: Jun–Aug. British Columbia and Alberta to Montana, south to New Mexico and California.

Bistorta vivipara (L.) Delarbre (bearing live young, as to reproduction by bulblets) Serpent-grass. Plants (2) 5–30 (45) cm tall; rhizomes sometimes contorted. **LEAVES** basal and cauline; ocrea brown, 4–22 (27) mm long, glabrous; petiole attached to sheath, 0.6–4.5 (6) cm long, wingless, absent on distal cauline blades; basal blade linear to narrowly elliptic or narrowly ovate, (1) 2.5–6 (10) cm long, 0.5–2 (2.3) cm wide, often revolute, pubescent and glaucous abaxially, glabrous adaxially; cauline blade linear to linear-lanceolate. **INFL** narrowly elongate-cylindric, (1.5) 2–9 cm long, 0.4–1 cm wide; peduncle 1–5 cm long. **FLOWERS** 1–2 per ocreate fascicle; pedicel (1) 2–5 mm long; perianth greenish proximally, white or pink distally, rarely red, 2–4 mm long; tepals obovate; bulblets present at lower nodes, pyriform, pink to brown or purple; stamens included or exserted; anthers reddish or purplish. **ACHENES** dark brown, 2–3 mm long, dull, granular. n = mainly 48, 60. [*Polygonum viviparum* L.; *Persicaria vivipara* (L.) Ronse Decr.]. Moist flats and slopes in subalpine forest communities, subalpine and alpine meadows, or along stream and lakesides. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 2590–3960 m (8500–13000'). Flowering: Jun–Aug. Greenland to Alaska, south (in the West) to Arizona and New Mexico; Eurasia. Reproduction is mainly by bulblets, as achenes are rarely produced. Exceedingly variable, with numerous chromosome numbers ranging from $2n = 66$ to 132. In the Old World, the species is sometimes subdivided into varieties, but none seems worthy of taxonomic recognition.

Centrostegia A. Gray ex Benth. Red Triangles

James L. Reveal

(Greek *kentron*, spur, + *stegion*, roof, for the arched saccate spurs at base of the involucre) Plants annual herbs from a slender taproot. **STEMS** 1 to many, erect, sparsely glandular; caudex stems absent; aerial flowering stems usually erect, slender, solid, not brittle, arising directly from a root. **LEAVES** basal, rosulate, estipulate, usually petiolate; blade oblong to broadly spatulate, sparsely glandular. **INFL** cymose; branches spreading, open to diffuse, dichotomously branched, sparsely glandular; bracts semifoliaceous, 3, connate 1/4 their length, positioned to side of node, awn-

tipped. **PEDUNCLES** absent. **INVOLUCRES** tubular, prismatic, 3-angled, saccate and awn-tipped proximally; teeth 5, erect, awn-tipped. **FLOWERS** bisexual, 2 per involucre, not stipitate proximally, pedicellate; perianth nonaccrescent, white to pink, pubescent; tepals 6, petaloid, oblanceolate, monomorphic, bilobed apically; stamens 9; filaments distinct, glabrous; anthers pink to red, oblong; styles 3, erect to spreading, distinct; stigmas capitate. **ACHENES** trigonous, brown, not winged, glabrous; embryo curved. $x = 19$ (Goodman 1957; Reveal 1989, 2005a). Monospecific, southwestern North America.

Centrostegia thurberi A. Gray ex Benth. (George Thurber, 1821–1890, naturalist, author, and botanist with United States-Mexico Boundary Survey, 1850–1853) Plants 0.3–2 (3) dm tall, (0.6) 1–4 (5) dm across, sparsely glandular. **LEAVES** with blade (0.5) 1–3.5 (4) cm long, 0.3–0.8 (1) cm wide. **INFL** bracts (1) 2–6 (10) mm long, linear to linear-lanceolate, mostly spreading, commonly acerose; awns 1–2 mm long. **INVOLUCRES** (2) 3–6 (8) mm long; basal spurs with awns 0.2–2 mm long; teeth 3, flattened, keeled, each terminated by a short, erect awn 0.3–1 mm long. **FLOWERS** 2–3 (3.5) mm long; tepals oblanceolate, bilobed apically; filaments 1–3 mm long. **ACHENES** 2–2.5 mm long. $n = 19$. Sandy to gravelly flats and slopes in mixed grassland, saltbush, blackbrush, and chaparral communities, and in pine-oak and montane conifer woodlands. UTAH. 1125–2400 m (3700–7875'). Flowering: Mar–Jun. Mojave and Sonoran deserts of southern California, southern Nevada, and southern Utah, south through Arizona to Baja California and Sonora, Mexico.

Chorizanthe R. Br. ex Benth. Spineflower

James L. Reveal

(Greek *chorizo*, to divide, + *anthos*, referring to the tepals of the flower) Plants annual (ours) or perennial herbs or subshrubs; root a slender to woody taproot. **STEMS** 1 to many, prostrate or decumbent to erect, glabrous or pubescent, sometimes glandular; caudex stems absent (ours) or woody, compact to spreading; aerial flowering stems usually erect or nearly so (ours), sometimes prostrate to decumbent, slender, solid, sometimes brittle and breaking into segments, arising from nodes of caudex branches, at distal nodes of aerial caudex branches, or directly from a root (ours). **LEAVES** basal or basal and cauline, alternate, estipulate, usually petiolate; blade linear to oblanceolate or spatulate, variously pubescent. **INFL** cymose (ours), sometimes capitate; branches spreading to erect, open to diffuse, tomentose to floccose or glabrous, occasionally glandular; bracts foliaceous to subulate or linear, mostly 2 and opposite, connate proximally, proximal to node, occasionally awn-tipped. **PEDUNCLES** absent. **INVOLUCRES** tubular, cylindric to urceolate or turbinate to campanulate, 3–6-ribbed, sometimes with a membranaceous or scarious margin; teeth 3, 5, or 6, erect, awn-tipped. **FLOWERS** bisexual, 1 (2) per involucre, not stipitate proximally, pedicellate; perianth nonaccrescent, white to yellow, pink to rose-pink, or red to maroon or purple, glabrous or pubescent; tepals (5) 6, petaloid, linear to ovate, connate 2/3 their lengths, monomorphic or dimorphic, entire to lobed or variously fringed; stamens 3, 6, or 9, or variously 3–9; filaments distinct or connate into staminal tube, sometimes adnate to floral tube; anthers maroon to red or cream to white or yellow, oblong to oval; styles 3, erect to spreading, distinct; stigmas capitate. **ACHENES** lenticular or rarely trigonous, light to dark brown or black, not winged, glabrous; embryo straight or curved. $x = 10$ (Goodman 1934; Hardham 1989; Reveal and Hardham 1989; Reveal 2005b). About 50 species of temperate western North America (33 species) and temperate South America (mainly Chile).

Chorizanthe brevicornu Torr. (alluding to the short, divergent involucral teeth) Plants annual, spreading to erect, 0.5–3 (5) cm tall and 0.5–3 dm across. **STEMS** brittle and breaking into segments in mature, dry plants. **LEAVES** basal; blade oblanceolate to narrowly elliptic (ours) or spatulate, (1) 1.5–3 (4) cm long, 0.1–1 cm wide, pubescent; petiole 0.5–2 cm long, pubescent. **INFL** cymose; branches thinly pubescent, often with appressed hairs, infrequently somewhat strigose or glabrate, brittle and often breaking into segments, green to reddish; bracts 2, opposite, similar to the proximal blades only more reduced, 0.3–1 (1.5) cm long, 0.1–0.25 cm wide, becoming scalelike at distal nodes, linear and acicular; awns 0.2–0.5 mm long. **INVOLUCRES** cylindric, 3-angled but 6-ribbed, 3–5 mm long, green, not corrugate, thinly strigose; teeth 6, spreading, divergent, 0.4–1.2 mm long; awns uncinate, 0.2–0.5 mm long. **FLOWERS** greenish white to white or pale yellowish white, 2–4 mm long, glabrous; tepals monomorphic, connate 3/4 their length, linear to narrowly oblanceolate; stamens 3; filaments distinct, adnate at top of floral tube, 2–3.5 mm long, glabrous. **ACHENES** dark brown, lenticular, 3–4 mm long. Sandy to gravelly flats and slopes in mixed grassland, saltbush, creosote bush, blackbrush, and sagebrush communities, and in piñon and/or juniper woodlands. UTAH. 1125–1220 m (3700–4000'). Flowering: Feb–Jul. Great Basin of southeastern Oregon and southern Idaho south through Nevada and Utah to northern Arizona, and in the Mojave and Sonoran deserts of southern California, Arizona, and Mexico (Baja California and Sonora). Our plants are the southern **var. *brevicornu***, primarily of the Mojave and Sonoran deserts, with leaves 0.1–0.3 (0.5) cm wide. Dried specimens tend to fragment due to the brittle nature of the stems and branches.

Eriogonum Michx. Wild Buckwheat

James L. Reveal

(Greek *erion*, wool, + *gonu*, knee, referring to the tomentose nodes of the type species, *Eriogonum tomentosum*) Plants annual or perennial herbs, subshrubs, or shrubs; root a slender to woody taproot, rarely somewhat tuberous and chambered. **STEMS** 1 to many, prostrate or decumbent to erect, herbaceous or woody, glabrous or pubescent, sometimes glandular; caudex stems woody, compact to spreading; aerial flowering stems herbaceous, usually erect or nearly so, slender to stout, solid or hollow and sometimes fistulose, arising from nodes of caudex branches, at distal nodes of aerial caudex branches, or directly from a root. **LEAVES** basal or basal and cauline, sometimes sheathing, alternate, opposite, or whorled, estipulate, usually petiolate; blades linear to orbicular, variously pubescent, glandular or glabrous. **INFL** cymose, racemose, simple or compound umbellate, or capitate; branches spreading to erect, open to diffuse, variously tomentose to floccose or glabrous, occasionally glandular, rarely scabrellous; bracts foliaceous to scalelike, usually 3, connate proximally, proximal to node, not awn-tipped. **PEDUNCLES** absent or capillary or filiform to slender or stout, straight or curved, erect, horizontal, or deflexed, glabrous or variously pubescent, sometimes glandular. **INVOLUCRES** tubular, cylindric or narrowly turbinate to broadly campanulate or hemispheric; teeth 3–10 and erect, or 5–10-lobed and recurved, not awn-tipped. **FLOWERS** bisexual or polygamodioecious, (2) 6–100 per involucre, occasionally stipitate proximally, pedicellate; perianth nonaccrescent, mostly white to red or yellow, glabrous to variously pubescent or glandular; tepals 6, petaloid, oblanceolate to oval, connate 1/5–1/2, monomorphic or dimorphic, entire; stamens 9; filaments distinct; anthers usually red to cream or yellow, mostly oblong; styles 3, usually erect, distinct; stigmas capitate. **ACHENES** lenticular or trigonous, light brown to brown, maroon, or black, glabrous or pubescent at least on beak, smooth, 3-angled, -ridged, or -winged; embryo curved or straight. $x = 10$ (Reveal 2004, 2005c). About 250 species of temperate North America (225 north of Mexico). The largest endemic North American genus in terms of numbers of species. A paraphyletic group ultimately to be enlarged to include all genera of the tribe *Eriogoneae* (some 325 species) or reduced to two species. Several species are worthy of cultivation; an important source of honey, especially in the chaparral of California.

1. Plants perennial ..... (2)
1' Plants annual ..... (21)

2. Flowers stipitate ..... (3)
2' Flowers not stipitate ..... (5)

3. Flowers glabrous ..... ***E. umbellatum***
3' Flowers pubescent ..... (4)

4. Flowers white to cream; inflorescences compound umbellate ..... ***E. jamesii***
4' Flowers yellow; inflorescences capitate or umbellate ..... ***E. arcuatum***

5. Achenes winged; plants monocarpic ..... ***E. alatum***
5' Achenes not winged; plants polycarpic (flowering and fruiting annually) ..... (6)

6. Leaves short-hirsute on both surfaces ..... ***E. inflatum***
6' Leaves variously tomentose to floccose at least abaxially ..... (7)

7. Plants caespitose or matted ..... (8)
7' Plants not caespitose or matted ..... (10)

8. Flowers and achenes glabrous ..... ***E. ovalifolium***
8' Flowers and achenes pubescent ..... (9)

9. Involucres (2) 4–6 mm long, deeply 5–10-toothed; perianth (ours) mostly white or rose to yellow; northern Arizona and northern New Mexico ..... ***E. shockleyi***
9' Involucres (2) 3–4 mm long, 5-toothed; perianth yellow; northeastern Arizona and northern New Mexico ..... ***E. lachnogynum***

10. Plants erect herbs with racemose inflorescences ..... (11)
10' Plants shrubs or subshrubs with nonracemose inflorescences or involucres racemose only at tips of distal inflorescence branches ..... (12)

11. Stems and inflorescence branches pubescent, not fistulose ..... ***E. racemosum***
11' Stems and inflorescence branches glabrous, fistulose ..... ***E. zionis***

12. Leaf blades tightly revolute, narrow ..... (13)
12' Leaves not tightly revolute, plane or merely slightly rolled, narrow to elliptic or nearly orbicular ..... (16)

13. Leaves (1.5) 2–6 cm long, glabrous and green adaxially; inflorescences compact, bright green; inflorescence branches glabrous; plants rounded shrubs ..... ***E. leptophyllum***
13' Leaves 0.5–1.5 (1.8) cm long, tomentose to glabrous and green or grayish adaxially; inflorescences open, gray; inflorescence branches tomentose to floccose or glabrous; plants various ..... (14)

14. Involucres 2–3 mm long; leaves floccose adaxially; open subshrubs to shrubs ..... ***E. microthecum***
14' Involucres (3.5) 4–6 mm long; leaves mostly glabrous adaxially; compact to open subshrubs ..... (15)

15. Flowers 3–3.5 mm long; leaves in fascicles; outer tepals obovate to nearly fan-shaped; stems and inflorescence branches hairy ..... ***E. clavellatum***
15' Flowers 4–5 mm long; leaves not in fascicles; outer tepals narrowly oblong; stems and inflorescence branches glabrous ..... ***E. lonchophyllum***

16. Leaf apices rounded or nearly so, the blades 1–4 cm long; flowers white or yellow; plants large, rounded shrubs ..... ***E. corymbosum***
16' Leaf apices acute, the blades (1) 1.5–4 (6) cm long; flowers white; plants various ..... (17)

17. Leaves 1–2 mm wide, 0.5–1.8 (2.5) cm long; inflorescences compact and often flat-topped; plants subshrubs to shrubs, (2) 4–15 tall ..... ***E. microthecum***
17' Leaves 2–20 mm wide; inflorescences mostly open; plants herbaceous perennials to shrubs ..... (18)

18. Plants grayish to reddish brown tomentose to floccose, with numerous stems and branches, the tomentum often drying blackish; leaves cauline, (1) 1.5–3 cm long, 0.2–0.7 cm wide ..... ***E. effusum***
18' Plants greenish or whitish floccose or glabrous, with few to many stems and branches, the tomentum not drying blackish; leaves basal or cauline, 0.5–2 cm long, 0.2–2 cm wide ..... (19)

19. Inflorescences without involucres racemosely arranged distally; herbs or subshrubs; peduncles 1–8 mm, glabrous; aerial flowering stems glabrous, grayish ..... ***E. lonchophyllum***
19' Inflorescences with involucres racemosely arranged distally; subshrubs or shrubs; peduncles absent; aerial stems tomentose to floccose or, if glabrous, usually greenish ..... (20)

20. Aerial flowering stems and inflorescence branches floccose or glabrous and greenish; plants mainly of moving sand habitats ..... ***E. leptocladon***
20' Aerial flowering stems and inflorescence branches tomentose to floccose and grayish; plants mainly of gravelly to rocky places ..... ***E. wrightii***

21. Leaves hirsute or pilose and greenish on both surfaces ..... (22)
21' Leaves tomentose to floccose at least abaxially ..... (24)

22. Leaves basal and cauline; plants spreading ..... ***E. divaricatum***
22' Leaves basal; plants erect ..... (23)

23. Stems fistulose; flowers hirsute, yellow ..... ***E. fusiforme***
23' Stems not fistulose; flowers glabrous, white ..... ***E. gordonii***

24. Stems and inflorescence branches tomentose to floccose, whitish or grayish ..... (25)
24' Stems and inflorescence branches glabrous or scabrellous, green, reddish, or grayish ..... (27)

25. Flowers densely pubescent adaxially; peduncles erect, 1–5 mm long; tepals not fan-shaped; plants biennial or late-season annual ..... ***E. annuum***
25' Flowers glabrous adaxially; peduncles absent; tepals fan-shaped; plants annual ..... (26)

26. Leaves basal; leaf blades suborbicular to cordate ..... ***E. palmerianum***
26' Leaves cauline; leaf blades narrowly oblanceolate to broadly elliptic ..... ***E. polycladon***

27. Outer tepals monomorphic ..... (28)
27' Outer tepals dimorphic ..... (29)

28. Involucres 4-lobed; flowers yellowish to red; plants spreading ..... ***E. wetherillii***
28' Involucres 5-lobed; flowers white to rose; plants erect ..... ***E. subreniforme***

29. Outer tepals pandurate; tepal margins crisped ..... ***E. cernuum***
29' Outer tepals obovate to ovate; tepal margins not crisped ..... (30)

30. Stems and inflorescence branches floccose and scabrellous ..... ***E. scabrellum***
30' Stems and inflorescence branches glabrous ..... (31)

31. Flowers white ..... ***E. deflexum***
31' Flowers yellow ..... ***E. hookeri***

Eriogonum alatum Torr. (winged, as to the winged achenes) Winged wild buckwheat. Plants tall, erect, monocarpic herbaceous perennials, 5–13 (17) dm high. **STEMS** mostly 1, erect, 2–13 dm long, strigose. **LEAVES** basal, infrequently cauline; petiole 2–5 cm, strigose; basal blade lanceolate to oblanceolate, (3) 5–15 cm long, 0.3–1.5 cm wide, strigose or glabrous except for margins and midvein; margin entire, plane; cauline blade 1–6 cm long. **INFL** cymose, 20–100 cm long; branches strigose; bracts 3, foliaceous and linear to linear-lanceolate, 2–9 mm long, 1–3 mm wide proximally, scalelike and triangular, 0.8–5 mm long, 0.5–2 mm wide distally. **PEDUNCLES** erect, straight or curving upward, 5–35 mm long, strigose. **INVOLUCRES** turbinate to campanulate, 2–4 (4.5) mm long, 2–4 (4.5) mm wide; teeth 5, 1–1.8 mm long. **FLOWERS** bisexual, nonstipitate; perianth yellow to yellowish green, 1.5–2.5 mm in anthesis, 3–6 mm and often reddish in fruit, glabrous; tepals monomorphic, lanceolate, connate 1/4 their length; stamens exserted, 1.5–3 mm long; filaments glabrous. **ACHENES** broadly trigonous, yellowish green to reddish brown, 5–8 mm long, 3–6 mm wide, glabrous, 3-winged. $n = 20$. [*E. alatum* var. *mogollense* S. Stokes ex. M. E. Jones; *E. alatum* subsp. *mogollense* (S. Stokes ex. M. E. Jones) S. Stokes; *E. alatum* subsp. *triste* (S. Watson) S. Stokes; *E. triste* S. Watson; *Pterogonum alatum* (Torr.) H. Gross]. Sandy to gravelly flats and slopes in mixed grassland, saltbush, and sagebrush communities, and in oaks, piñon and/or juniper, and montane conifer woodlands. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1350–3100 m (4430–10170'). Flowering: Jun–Oct. Northern Arizona and eastern Utah east through Colorado and southeastern Wyoming to southwest Nebraska, western Kansas, New Mexico, western Oklahoma, and northern and western Texas, to Chihuahua, Mexico. Our plants as described here are **var. *alatum***. Used for pain, food, and ceremonial items by the Navajo. Kayenta Navajo used it as a lotion for rashes and as a "life medicine." Ramah Navajo used it as a ceremonial medicine, cough medicine, and dermatological aid.

Eriogonum annuum Nutt. (annual, the first named nonperennial of the genus) Plants tall, leafy, erect, herbaceous biennials and late-season annuals, 5–20 dm tall, 5–10 dm across. **STEMS** usually 1, erect, 4–10 (15) dm, densely tomentose to floccose. **LEAVES** basal in first-year rosettes, otherwise cauline and solitary or in fascicles; rosette petiole 0.3–1.2 cm long; cauline petiole 0.2–0.5 cm long, mostly tomentose; blade oblanceolate to oblong, 1–7 cm long, 0.3–1.5 cm wide, densely tomentose abaxially, floccose and grayish adaxially; margin mostly entire, infrequently slightly revolute. **INFL** cymose, 30–100 cm long, 20–70 cm wide; branches densely tomentose to floccose; bracts 3, scalelike, 1–4 mm long, 1–3 mm wide. **PEDUNCLES** erect, straight, stoutish, 1–5 mm long, usually absent distally, tomentose to floccose. **INVOLUCRES** turbinate to campanulate, 2.5–4 mm long, 2–3 mm wide, tomentose; teeth 5–6, erect, 0.4–1 mm long. **FLOWERS** polygamodioecious, nonstipitate; perianth white to rose, 1–2.5 mm long, glabrous abaxially, densely pubescent adaxially; tepals dimorphic, those of outer whorl obovate, those of inner whorl narrowly ovate to oblong, connate about 1/4–1/3 their length; stamens mostly included, 1–2 mm long; filaments pilose proximally. **ACHENES** trigonous, brown, 1.5–2 mm long, glabrous. $n = 20$. Sandy flats, slopes, and banks in mixed grassland, and in desert scrub, oak, and conifer woodlands. NMEX: McK, RAr, San. 1900–2300 m (6235–7545'). Flowering: Apr–Nov. Primarily of the Great Plains from North Dakota and eastern Montana south through eastern New Mexico and western Texas to Mexico. A potentially aggressive weed species.

Eriogonum arcuatum Greene (bow-shaped) Plants low, spreading, herbaceous perennials, 0.2–2.5 dm tall, (1) 2–4 (6) dm across. **STEMS** 1–several, erect or nearly so, (0.2) 0.5–2 dm long, floccose. **LEAVES** basal; petiole 0.5–2 cm long; blade oblanceolate to elliptic, (0.5) 1–3 cm long, 0.5–1.5 cm wide, densely tomentose abaxially, mostly floccose adaxially; margin entire, plane. **INFL** umbellate or compound umbellate, occasionally capitate, 3–20 cm long and wide; branches floccose; bracts 3–8, semifoliaceous, narrowly elliptic at first node, (0.3) 0.5–2 cm long, (0.2) 0.4–1 cm wide. **PEDUNCLES** absent. **INVOLUCRES** campanulate, 3–7 mm long, (3) 4–8 mm wide, floccose; teeth 5–8, erect, 0.1–0.5

mm long. **FLOWERS** bisexual, stipitate; perianth yellow, (4) 5–8 mm including 0.7–2 mm long stipe, densely pubescent; tepals dimorphic, those of outer whorl lanceolate to elliptic and 1.5–5 mm long, 1–3 mm wide, those of inner whorl lanceolate to fan-shaped, 1.5–7 mm long, 2–4 mm wide, connate 1/4–1/3 their length; stamens exserted, 2–4 mm long; filaments pilose proximally. **ACHENES** trigonous, light brown to brown, 4–5 mm long, glabrous except for sparsely pubescent beak. Sandy, clayey, gravelly, or rocky flats, slopes, and outcrops, ledges and cliffs in mixed grassland, saltbush, blackbrush, and sagebrush communities, and in piñon, juniper, or conifer woodlands. 1220–4200 m (3700–13780'). Flowering: Jun–Oct. Southeastern Wyoming, eastern Utah, and north-central Arizona eastward to central Colorado and northwestern New Mexico.

1. Involucres (3) 4–8 mm wide; inflorescences umbellate to compound umbellate, rarely capitate; flowers (4) 5–8 mm long ..... **var. *arcuatum***
1' Involucres 3–5 mm wide; inflorescences capitate; flowers 6–7 mm long ..... **var. *xanthum***

var. *arcuatum* (bent, as to curved inflorescence branches) Baker's wild buckwheat. Plants (1) 2–3 (6) dm across. **FLOWERING STEMS** mostly erect, (0.3) 0.5–2 dm. **LEAF BLADES** oblanceolate to elliptic, (0.5) 1–3 cm long, 0.5–1.5 cm wide. **INFL** umbellate and branched 1–3 times, rarely capitate; bracts (3) 5–20 mm long, (3) 4–10 mm wide. **INVOLUCRES** 3–7 mm long, (3) 4–8 mm wide. **FLOWERS** (4) 5–8 mm long including stipe. [*E. bakeri* Greene; *E. jamesii* Benth. var. *arcuatum* (Greene) S. Stokes; *E. jamesii* subsp. *bakeri* (Greene) S. Stokes; *E. jamesii* var. *flavescens* S. Watson; *E. jamesii* subsp. *flavescens* (S. Watson) S. Stokes; *E. jamesii* var. *higginsii* S. L. Welsh]. Sandy, clayey, gravelly, or rocky flats, slopes, and outcrops, ledges and cliffs in mixed grassland, saltbush, blackbrush, and sagebrush communities, and in piñon, juniper, or conifer woodlands. ARIZ: Apa, Nav; COLO: Arc, Hin, Min; NMEX: McK, San, SJn; UTAH. 1220–3000 m (3700–9840'). Flowering: Jun–Oct. Southeastern Wyoming, eastern Utah, and north-central Arizona eastward to southwestern Wyoming, central Colorado, and northwestern New Mexico.

var. *xanthum* (Small) Reveal (yellow, as to color of the flowers) Ivy League wild buckwheat. Plants 3–10 dm across. **FLOWERING STEMS** somewhat erect, 0.2–0.8 dm. **LEAF BLADES** oblanceolate to oblong, 1–2.5 cm long, 0.5–1 cm wide. **INFL** capitate, often reduced to a single involucre; bracts 3–10 mm long, 2–7 mm wide. **INVOLUCRES** 4–6 mm long, 3–5 mm wide. **FLOWERS** 6–7 mm long including stipe. [*E. chloranthum* Greene; *E. flavum* Nutt. subsp. *chloranthum* (Greene) S. Stokes; *E. flavum* var. *xanthum* (Small) S. Stokes; *E. jamesii* Benth. var. *xanthum* (Small) Reveal; *E. xanthum* Small]. Sandy, gravelly to rocky or talus slopes in high-elevation grassland, sagebrush, conifer woodlands, and tundra communities. COLO: Hin, SJn. 3000–4200 m (9840–13780'). Flowering: Jul–Sep. Rocky Mountains of central Colorado.

Eriogonum cernuum Nutt. (nodding, as to downwardly curved peduncle) Nodding wild buckwheat. Plants spreading to erect annuals, 0.5–6 dm high, 0.5–6 (10) dm across. **STEMS** 1–several, mostly erect, 0.3–2 dm long, glabrous, tomentose to floccose among sheathing leaves. **LEAVES** basal, sometimes sheathing up stems; petiole 1–4 cm long, tomentose; blade round-ovate to orbicular, (0.5) 1–2 (2.5) cm long, (0.5) 1–2 (2.5) cm wide, white to grayish tomentose abaxially, tomentose to floccose or glabrate and greenish adaxially; margin entire and plane. **INFL** cymose, open to sometimes diffuse, 0.5–5 dm high, 0.5–6 dm wide; bracts 3, scalelike, 1–2 mm long, 1–2.5 mm wide. **PEDUNCLES** cernuous, spreading to ascending or deflexed, straight or curved, slender, (1) 2–25 mm, glabrous, sometime lacking at distal nodes. **INVOLUCRES** turbinate, (1) 1.5–2 mm long, 1–1.5 mm wide, glabrous; teeth 5, erect, 0.4–0.7 mm long. **FLOWERS** bisexual, nonstipitate; perianth white to pinkish, becoming rose to red in fruit, 1–2 mm long, glabrous; tepals dimorphic, those of outer whorl panduriform with crisped margins and truncate bases, those of inner whorl obovate, connate proximally; stamens mostly excluded, 1–2 mm long; filaments pilose proximally. **ACHENES** trigonous, light brown to brown, 1.5–2 mm long, glabrous. [*E. cernuum* var. *psammophilum* S. L. Welsh; *E. cernuum* var. *tenue* Torr. & A. Gray; *E. cernuum* subsp. *tenue* (Torr. & A. Gray) S. Stokes]. Sandy to gravelly flats and slopes in mixed grassland, saltbush, sagebrush, and mountain mahogany communities, and in oak and conifer woodlands. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1220–2285 m (4000–7500'). Flowering: Apr–Oct. Eastern Washington south to central California, east to southern Saskatchewan, Montana, South Dakota, western Nebraska, Colorado, and northern Mexico. Kayenta Navajo used the plant for rashes and kidney disease, and the achenes were made into a mush for food. Ramah Navajo chewed the leaves and applied the poultice to red ant bites.

Eriogonum clavellatum Small **CP** (having nature of a small club, as to shape of the leaf blades) Comb Wash wild buckwheat. Plants low, heavily branched subshrubs, 1–2.5 dm tall, 3–8 dm across. **STEMS** numerous; caudex stems rather compact; aerial stems spreading to erect, 0.06–0.2 dm long, thinly floccose to glabrous, dark green. **LEAVES** cauline, in fascicles; petiole 0.05–0.1 cm long, tomentose to floccose, rarely glabrous; blade oblanceolate, 3–15 mm long,

0.5–2 mm wide, densely white-tomentose abaxially, thinly tomentose and grayish to (rarely) glabrous and green adaxially; margin entire, tightly revolute. **INFL** umbellate to cymose, compact, 0.5–1.5 cm long, 1–2 dm wide; branches thinly floccose or glabrous, dark green; bracts 3, scalelike, 1.5–2.5 (3) mm long, 1–2.5 mm wide. **PEDUNCLES** erect, straight, stout, 1.5–8 mm long, glabrous. **INVOLUCRES** turbinate-campanulate, (3) 3.5–4.5 (5) mm long, 2.5–4.5 mm wide, glabrous; teeth 5, erect, 0.6–0.9 mm long. **FLOWERS** bisexual, nonstipitate; perianth white, (2.5) 3–3.5 mm long, glabrous; tepals dimorphic, those of the outer whorl obovate to nearly fan-shaped, 2–2.5 mm wide, those of the inner whorl slightly shorter and oblanceolate to spatulate, connate 1/4–1/3 their length; stamens long-exserted, 3–6 mm long; filaments sparsely pilose proximally. **ACHENES** trigonous, light brown, 3–3.5 mm long, glabrous. Sandy to heavy clay washes and slopes; saltbush communities. ARIZ: Apa; COLO: Mon; NMEX: SJn; UTAH. 1350–1750 m (4430–5740'). Flowering: May–Jul. A Four Corners regional endemic.

Eriogonum corymbosum Benth. (bunch of flowers, as to the corymbose inflorescence) Plants low subshrubs to large, rounded, diffusely branched and spreading shrubs, 2–8 (1.2) dm tall, 3–15 (25) dm across, grayish to reddish brown tomentose to floccose or glabrous and grayish or greenish. **STEMS** numerous; caudex stems spreading to erect (ours), rarely matted; aerial flowering stems spreading to erect (ours), rarely scapose, (0.5) 1–2 dm, grayish to reddish brown tomentose to floccose or glabrous and grayish or greenish. **LEAVES** cauline, not in fascicles; petioles 0.2–1.5 cm long, tomentose to floccose; blade lanceolate to oblanceolate or elliptic to nearly orbicular, (0.5) 1–3 (4.5) cm long, (0.3) 0.5–3 (3.5) cm wide, densely white-, tannish-, or brownish-tomentose on both surfaces or less so to nearly glabrous and green abaxially; margin often crisped, occasionally crenulate. **INFL** cymose, diffuse to rather open (ours), rarely capitate, (1) 3–20 cm long, 2–25 (30) cm wide; branches tomentose to glabrous; bracts 3, scalelike, 1–3 (6) mm long, mostly triangular, or foliaceous, 1–2.5 cm long and similar to the blades. **PEDUNCLES** lacking. **INVOLUCRES** turbinate, 1.5–3.5 mm long, 1–2 (2.5) mm wide, tomentose to floccose, occasionally glabrate or glabrous; teeth 5, erect, 0.3–1 mm long. **FLOWERS** bisexual, nonstipitate; perianth white or pale yellow to yellow, 2–3.5 (4) mm long, glabrous (ours), rarely sparsely pilose; tepals essentially monomorphic, oblanceolate to spatulate, connate 1/4–1/3 their length; stamens mostly included to slightly exserted, 1–4 (5) mm long; filaments typically pilose proximally. **ACHENES** trigonous, brown, 2–2.5 (3) mm long, glabrous except for the occasionally papillate beak. Sandy to gravelly or clayey flats, washes, slopes, outcrops, and cliffs; saltbush, blackbrush, and sagebrush communities, piñon-juniper and montane conifer woodlands. 1200–2800 m (3935–9185'). Southern Nevada and northwestern Arizona eastward onto the Colorado Plateau from southwestern Wyoming south to northwestern New Mexico, disjunct in northwestern Texas. A species of eight varieties; we have three. The Hopi boiled the plant (probably var. *glutinosum*), mixed it with water and cornmeal, and then baked it into bread.

1. Flowers in a population mainly pale yellow to yellow; common ..... **var. *glutinosum***
1' Flowers in a population mainly white or brownish white ..... (2)

2. Leaves mostly broadly elliptic to oblong or ovate, densely white-tomentose abaxially, floccose and brownish or yellowish white adaxially; plants brownish white tomentose; flowers mostly 2–2.5 mm; common ..... **var. *velutinum***
2' Leaves mostly broadly ovate to nearly orbicular, densely grayish tomentose abaxially, often subglabrous to glabrous and green adaxially; plants greenish tomentose; flowers mostly 2.5–3 mm; San Juan County, Utah ..... **var. *orbiculatum***

var. *glutinosum* (M. E. Jones) M. E. Jones (sticky, as to a mistaken observation that inflorescences are viscid) Sticky wild buckwheat. Plants subshrubs or shrubs, 2–10 dm tall, 3–10 dm across. **LEAF BLADES** lanceolate to oblanceolate or elliptic, 1–4 cm long, 0.5–1.5 cm wide, usually densely tomentose on both surfaces, sometimes less so and greenish adaxially. **INFL** 3–10 cm long, tomentose to floccose. **INVOLUCRES** 1–2 mm long, 1–1.5 (2) mm wide. **PERIANTH** pale yellow to yellow in a population, sometimes with white-flowered individuals, 1.5–2.5 mm long. [*E. aureum* M. E. Jones var. *glutinosum* M. E. Jones; *E. microthecum* Nutt. var. *crispum* (L. O. Williams) S. Stokes]. Sandy to gravelly flats, washes, and slopes in mixed grassland, saltbush, blackbrush, and infrequently in sagebrush communities, and occasionally in piñon-juniper woodlands. ARIZ: Apa, Coc, Nav; UTAH. 1600–2300 m (5250–7545'). Flowering: Jul–Oct. Northern Arizona and southern Utah.

var. *orbiculatum* (S. Stokes) Reveal & Brotherson (having the nature of a circle, as to leaf shape) Orbicular-leaf wild buckwheat. Plants mostly large shrubs, (3) 5–15 dm tall, 5–15 dm across. **LEAF BLADES** broadly ovate to nearly orbicular, 1–3 cm long and wide, floccose to tomentose on both surfaces, or floccose adaxially. **INFL** 3–10 cm long, compact and rather flat-topped, densely tomentose. **INVOLUCRES** 2–3.5 mm long, 1.5–2.5 mm wide. **PERIANTHS** white, 2.5–3 mm long. [*E. effusum* Nutt. subsp. *orbiculatum* S. Stokes]. Sandy to gravelly flats, washes, and slopes in

mixed grassland, saltbush, blackbrush, and infrequently in sagebrush communities, and occasionally in piñon-juniper woodlands. COLO: Dol, Mon; UTAH. 1600–2300 m (5250–7545'). Flowering: Aug–Oct. Southeastern Utah and northeastern Arizona east into western Colorado.

var. velutinum Reveal (velvety, as to the hairs on the abaxial surface of leaves) Velvety wild buckwheat. Plants large shrubs, 5–10 dm tall, 8–15 (20) dm wide. **LEAF BLADES** broadly elliptic to oblong, 1.5–3 (3.5) cm long, (1) 1.5–2.5 (3.5) cm wide, densely white-tomentose abaxially, less so to brownish floccose adaxially. **INFL** 3–10 cm long, rather open, densely tomentose. **INVOLUCRES** 2–3.5 mm long, 1.5–2.5 mm wide. **PERIANTHS** white, 2–2.5 (3) mm long. Sandy to gravelly or clayey flats, washes, and slopes; mixed grassland, saltbush, and sagebrush communities, and in piñon-juniper woodlands. ARIZ: Apa, Nav; COLO: Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1250–2300 m (4100–7545'). Flowering: Aug–Oct. Eastern Utah and western Colorado south to northeastern Arizona and northwestern New Mexico, disjunct in northern Texas. This is our common morphology, but it can be difficult to distinguish from var. *orbiculatum*.

Eriogonum deflexum Torr. (pointing down, as to position of involucre on branch) Skeleton weed. Plants erect to spreading annuals, (0.5) 1–5 (20) dm high. **STEMS** mostly 1, erect, 0.3–3 (4) dm long, glabrous, not fistulose. **LEAVES** basal; petiole 1–7 cm, mostly floccose; blade cordate to reniform or nearly orbicular, 1–2.5 (4) cm long, 2–4 (5) cm wide, densely white-tomentose abaxially, less so to floccose or subglabrous and grayish to greenish adaxially; margin entire, plane. **INFL** cymose, open to diffuse, often flat-topped, 1–4.5 (16) dm high; branches glabrous; bracts 3, scalelike, 1–3 mm long, 0.5–1.5 mm. **PEDUNCLES** deflexed, rarely some slightly erect, slender to stout, 0–5 mm, glabrous. **INVOLUCRES** turbinate, 1.5–2.5 mm long, 1–2 mm wide, glabrous; teeth 5, erect, (0.2) 0.5–1 mm. **FLOWERS** bisexual, nonstipitate; perianth white to pink, becoming pinkish to reddish in fruit, 1–2 mm, glabrous; tepals dimorphic, those of the outer whorl ovate with cordate bases, those of the inner whorl lanceolate to narrowly ovate; stamens included, 1–1.5 mm long; filaments glabrous or sparsely pilose proximally. **ACHENES** trigonous, brown to dark brown, (1.5) 2–3 mm, glabrous. $n = 20$. [*E. deflexum* f. *stenopetala* H. Gross; *E. deflexum* subsp. *insigne* (S. Watson) S. Stokes; *E. deflexum* var. *insigne* (S. Watson) M. E. Jones; *E. deflexum* var. *turbinatum* (Small) Reveal; *E. insigne* S. Watson; *E. turbinatum* Small]. Sandy to gravelly washes, flats, and slopes in saltbush, greasewood, blackbrush, and sagebrush communities, and in piñon-juniper woodlands. UTAH. 1850–2000 m (6070–6560'). Flowering: (Jan) May–Oct (Dec). Southeastern California across southern Nevada to southern Utah, Arizona, and southwestern New Mexico, south into northern Baja California and northwestern Sonora, Mexico. Our plants, as described here, are **var. *deflexum***. Some individuals in the Lake Powell region have involucres with more or less erect peduncles.

Eriogonum divaricatum Hook. (spread apart, as to spreading branching pattern) Divergent wild buckwheat. Plants low, spreading annuals, 1–2 (3) dm high. **STEMS** decumbent to spreading, 0.3–0.5 dm long, puberulent to short-pilose. **LEAVES** basal and cauline; basal petiole 2–4 cm, mostly short-pilose; cauline petiole (0) 0.1–2 cm long; basal blade elliptic-oblong to orbicular, 1–3 cm long and wide, puberulent to short-pilose and green on both surfaces; cauline blade opposite, oblanceolate to oblong or elliptic, 0.3–1 (1.5) cm long, 0.2–0.8 (1.2) cm wide, similar to the basal blades. **INFL** cymose, distally uniparous due to suppression of secondary branches, diffuse, 5–25 cm long, 10–45 cm wide; branches puberulent; bracts 3, scalelike, 1–3 (5) mm long, 1–2 mm wide. **PEDUNCLES** absent. **INVOLUCRES** turbinate, 1–2 mm long, 1–1.5 (2) mm wide, pilose; teeth 5, spreading to somewhat reflexed, 0.7–1.5 mm long. **FLOWERS** bisexual, nonstipitate; perianth yellow, rarely pale yellow, (1) 1.5–2 mm, hispidulous and glandular with yellowish white hairs; tepals monomorphic, oblong-lanceolate to oblong-ovate, connate proximally; stamens included, 0.7–1.5 mm long; filaments pilose proximally. **ACHENES** trigonous, light brown, 1.5–2 mm long, glabrous. Heavy clay flats and slopes in saltbush, greasewood, and sagebrush communities, and in piñon-juniper woodlands. ARIZ: Apa, Coc, Nav; COLO: Mon; NMEX: McK, San, SJn; UTAH. 1150–2300 m (3770–7545'). Flowering: May–Oct. Colorado Plateau of southwestern Wyoming south through eastern Utah and western Colorado to northern Arizona and northwestern New Mexico; disjunct in west-central Utah. *Eriogonum divaricatum* was found in Argentina twice in 1899–1900. These plants were named *E. ameghinoi* Speg. and ultimately became the only species of the genus *Sanmartinia* Buchinger. The plants, probably introduced by migrating birds, did not persist in South America (Reveal 1981). Kayenta Navajo used the plant as a ceremonial medicine, orthopedic aid, and snakebite remedy.

Eriogonum effusum Nutt. (pour out, as to many spreading branches) Spreading wild buckwheat. Plants large, spreading, diffusely branched shrubs, (1.5) 2–5 (7) dm tall, 5–15 dm across. **STEMS** numerous; caudex compact to spreading; aerial flowering stems 0.3–0.8 dm long, floccose to glabrous, grayish. **LEAVES** cauline, not in fascicles; petiole 0.2–0.7 cm, tomentose to floccose; blade oblanceolate to oblong or obovate, (1) 1.5–3 cm long, (0.2) 0.3–0.7 cm wide, densely white-tomentose abaxially, white-floccose and grayish to glabrate or glabrous and greenish adaxially;

margin entire, plane. **INFL** cymose, diffuse and often congested, 10–30 (40) cm long, 10–40 cm wide; branches usually slender, white-floccose to glabrate and greenish; bracts 3, scalelike, 0.5–2 (5) mm long, 0.5–2 mm wide. **PEDUNCLES** erect, straight, slender, 3–25 mm long, floccose, often absent distally. **INVOLUCRES** turbinate, 1.5–2.5 (3) mm long, 1–2 mm wide, tomentose to floccose; teeth 5, erect, 0.3–0.6 mm long. **FLOWERS** bisexual, nonstipitate; perianth white, becoming reddish, 2–4 mm long, glabrous; tepals essentially monomorphic, elliptic to obovate, connate 1/4 their length; stamens mostly exserted, 2–4.5 mm long; filaments sparsely pilose proximally. **ACHENES** trigonous, brown, 2–2.5 mm long, glabrous. [*E. microthecum* Nutt. var. *effusum* (Nutt.) Torr. & A. Gray]. Sandy to rocky slopes and flats mainly in grassland and sagebrush communities, and in juniper or infrequently montane conifer woodlands. NMEX: McK, San, SJn. 1640–2500 m (5000–8200'). Flowering: Jun–Sep (Oct). Mainly of the Great Plains and eastern slope of the Rocky Mountains from southwestern South Dakota, southwestern Nebraska, and southeastern Wyoming south through central and eastern Colorado to northeastern New Mexico, then scattered westward to our area. Difficult to distinguish from the more westerly *E. nummulare* M. E. Jones of the Intermountain region just to our west.

Eriogonum fusiforme Small (shape of a spindle, as to fistulose stems and branches) Grand Valley desert trumpet. Plants spreading annuals, (0.3) 0.5–4 dm high. **STEMS** usually 1, erect, 0.5–1.5 dm long, conspicuously fistulose, glabrous, villous proximally. **LEAVES** basal; petiole 1–3 cm, hirsute; blade ovate to round, 0.5–3 cm long, 0.5–2.5 cm wide, short-hirsute and greenish on both surfaces; margin entire, plane. **INFL** cymose, open, 5–30 cm long, 5–30 cm wide; branches glabrous, fistulose; bracts 3, scalelike, 1–2 mm long, 1–1.5 mm wide. **PEDUNCLES** erect, straight, filiform to capillary, 10–20 mm long, glabrous. **INVOLUCRES** turbinate, 1–1.2 mm long, 0.7–1 mm wide, glabrous; teeth (4) 5, erect, 0.4–0.6 mm long. **FLOWERS** bisexual, nonstipitate; perianth yellow, 1.3–1.6 mm, densely hirsute with coarse curved hair; tepals monomorphic, ovate; stamens exserted, 1.3–1.8 mm long; filaments sparsely pubescent proximally. **ACHENES** lenticular to trigonous, light brown, 1.3–1.8 (2) mm long, glabrous. $n = 16$. [*E. inflatum* Torr. & Frém. var. *fusiforme* (Small) Reveal]. Heavy clay, sometimes gravelly, flats and slopes in saltbush and greasewood communities. UTAH. 1150–2000 m (3770–6560'). Flowering: Apr–Jul. Colorado Plateau of southwestern Wyoming, eastern Utah, and western Colorado.

Eriogonum gordonii Benth. (Alexander Gordon, 1813–1873, British collector with Sir William Drummond Stewart in the Rocky Mountains in 1843, later collected seeds in Colorado and northern New Mexico for George Charlwood, a nurseryman) Gordon's wild buckwheat. Plants erect to spreading annuals, (0.5) 1–5 (7) dm high. **STEMS** usually 1, erect, 0.5–1.5 (3) dm long, glabrous, sometimes sparsely hispid proximally, grayish. **LEAVES** basal; petiole 1–5 cm long, glabrous to sparsely hirsute; blade obovate to round or reniform, 1–5 cm long and wide, sparsely villous to hirsute and green on both surfaces, becoming glabrous with age; margin entire, plane. **INFL** cymose, open to diffuse, 5–40 (50) cm long, 5–50 cm wide; branches glabrous, rarely sparsely hispid, not fistulose; bracts 3, scalelike, 0.5–2 (3) mm long, 0.5–2.5 mm wide. **PEDUNCLES** erect, straight, slender, 5–20 mm long, glabrous. **INVOLUCRES** campanulate, 0.6–1.5 mm long, 0.8–1.5 mm wide, glabrous; teeth 5, erect, 0.2–0.4 mm long. **FLOWERS** bisexual, nonstipitate; perianth white, rarely yellowish, becoming pink to rose in fruit, 1–2.5 mm, glabrous; tepals monomorphic, oblong to narrowly ovate; stamens included to exserted, 1–1.8 mm long; filaments glabrous. **ACHENES** trigonous, shiny light brown to brown, 2–2.5 mm long, glabrous. $n = 20$. Sandy to clayey flats and slopes in saltbush, greasewood, and sagebrush communities, and in piñon and/or juniper or montane conifer woodlands. ARIZ: Apa; COLO: Arc, LPl, Mon; NMEX: SJn; UTAH. 1220–2200 m (4000–7220'). Flowering: May–Oct. Southwestern South Dakota to Wyoming south through eastern Utah and western Colorado to northern Arizona and northwestern New Mexico.

Eriogonum hookeri S. Watson (Joseph Dalton Hooker, 1817–1911, British botanist at Kew, visited western United States in 1877 with Asa Gray) Hooker's wild buckwheat. Plants erect annuals, 1–6 dm high. **STEMS** mostly 1, erect, 0.1–0.4 dm long, glabrous, not fistulose. **LEAVES** basal; petiole 1–5 cm long, tomentose; blade cordate to subreniform, (1) 2–5 cm long, 2–6 cm wide, densely white felty-tomentose abaxially, tomentose and grayish adaxially; margin occasionally wavy. **INFL** cymose, open to diffuse, spreading to subglobose or flat-topped to umbrella-shaped, 5–35 cm long, 5–50 cm wide; branches glabrous; bracts 3, scalelike, 1–3 mm long, 0.5–1.5 mm wide. **PEDUNCLES** absent. **INVOLUCRES** deflexed, broadly campanulate to hemispheric, 1–2 mm long, 1.5–3 (3.5) mm wide, glabrous; teeth 5, erect, 0.5–0.7 mm long. **FLOWERS** bisexual, nonstipitate; perianth yellow to reddish yellow, 1.5–2 mm long, glabrous; tepals dimorphic, those of the outer whorl orbicular with cordate bases, those of the inner whorl narrowly ovate; stamens mostly included, 1.3–1.5 mm long; filaments glabrous. **ACHENES** trigonous, light brown, 2–2.5 mm long, glabrous. $n = 20$. [*E. deflexum* Torr. var. *gilvum* S. Stokes; *E. deflexum* subsp. *hookeri* (S. Watson) S. Stokes]. Sandy washes, flats, and slopes in saltbush, greasewood, sagebrush, and mountain mahogany communities, and in piñon-juniper woodlands.

ARIZ: Apa; COLO: Mon; NMEX: SJn; UTAH. 1300–2135 m (4265–7000'). Flowering: Jun–Oct. East-central California and south-central Oregon east across Nevada to southwestern Idaho, southwestern Wyoming, western Colorado, south to northern Arizona and northwestern New Mexico. Hopi used the plant for flavoring mush.

Eriogonum inflatum Torr. & Frém. (referring to the fistulose stems and branches) Desert trumpet, Indian pipeweed. Plants erect, first-year flowering annuals or, more commonly, long-lived herbaceous perennials, 1–10 (15) dm high. **STEMS** 1–several, erect, (0.2) 2–5 dm long, usually fistulose, glabrous, occasionally hirsute proximally. **LEAVES** basal; petioles 2–6 cm long, hirsute; blades oblong-ovate to oblong or rounded to reniform, (0.5) 1–2.5 (3) cm long, (0.5) 1–2 (2.5) cm wide, short-hirsute and greenish on both surfaces, sometimes less so or glabrous and green adaxially; margin occasionally undulate. **INFL** cymose, open, 5–70 cm long; branches glabrous, occasionally fistulose; bracts 3, scalelike, 1–2.5 (5) mm long, 1–2.5 mm wide. **PEDUNCLES** erect, straight, filiform to capillary, 5–20 mm long, glabrous. **INVOLUCRES** turbinate, 1–1.5 mm long, 1–1.8 mm wide, glabrous; teeth 5, erect, 0.4–0.6 mm. **FLOWERS** bisexual, nonstipitate; perianth yellow, (1) 2–2.5 (3) mm long, densely hirsute with coarse curved hairs; tepals monomorphic, narrowly ovoid to ovate; stamens exserted, 1.3–2.5 mm long; filaments glabrous or sparsely pubescent proximally. **ACHENES** lenticular to trigonous, light brown to brown, 2–2.5 mm long, glabrous. $n = 16$. [*E. inflatum* var. *deflatum* I. M. Johnst.]. Sandy to gravelly washes, flats, and slopes in mixed grassland, saltbush, and sagebrush communities, and occasionally in piñon and/or juniper woodlands. ARIZ: Apa, Nav; COLO: Mon; NMEX: SJn; UTAH. 1125–1675 m (3700–5500'). Flowering: Mar–Oct (Dec). Eastern California east across central and southern Nevada to central and southern Utah and southwestern Colorado, south through Arizona and northwestern New Mexico to northern Sonora and southern Baja California, Mexico. Kayenta Navajo used the plant as a lotion for bear or dog bites.

Eriogonum jamesii Benth. (Edwin James, 1797–1861, surgeon-naturalist with the Long Expedition to the Rocky Mountains, 1819–1820) Antelope sage. Plants low, spreading, matted, herbaceous perennials, 1–4 dm tall, 3–8 dm across. **STEMS** several; caudex stems absent or more often matted, spreading; aerial flowering stems erect or nearly so, 0.5–1.5 dm long, tomentose to floccose. **LEAVES** basal; petiole 0.5–6 cm long; blade mostly narrowly elliptic, 1–3 (3.5) cm long, (0.3) 0.5–1 (1.2) cm wide, densely tomentose abaxially, less so to thinly tomentose and grayish to greenish adaxially; margin plane (ours) or undulate and crisped. **INFL** compound umbellate, 10–30 cm long, 10–25 cm wide; branches tomentose to floccose; bracts 3–9, semifoliaceous at proximal node, 5–20 mm long, 3–10 mm wide, becoming scalelike distally. **PEDUNCLES** lacking. **INVOLUCRES** turbinate, 1.5–7 mm long, 2–5 mm wide, tomentose to floccose; teeth 5–8, erect, 0.1–0.5 mm long. **FLOWERS** bisexual, stipitate; perianth white to cream, 3–8 mm including 0.7–2 mm long stipe, densely pubescent; tepals dimorphic, those of the outer whorl lanceolate to elliptic, 2–5 mm long, 1–3 mm wide, those of the inner whorl lanceolate to fan-shaped, 1.5–6 mm long, 2–4 mm, connate 1/4–1/3 their length; stamens exserted, 2–4 mm long; filaments pilose proximally. **ACHENES** trigonous, light brown to brown, 4–5 mm long, glabrous except for sparsely pubescent beak. $n = 20$. Sandy to gravelly or infrequently rocky flats and slopes in mixed grassland, saltbush, blackbrush, and sagebrush communities, and in oak, piñon and/or juniper, and montane conifer woodlands. ARIZ: Apa, Coc, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, San, SJn. 1465–2285 m (4800–7500'). Flowering: Jun–Oct. Northeastern Arizona, southern Colorado, southwestern Kansas, and western Oklahoma south through Arizona, New Mexico, and western Texas to central Mexico. Our plants, as described here, are **var. *jamesii***. Kayenta Navajo smoked the plant when disturbed by dreams of tobacco worms. Ramah Navajo used a decoction to ease labor pains. Also used as a contraceptive, gastrointestinal aid, and as a "life medicine."

Eriogonum lachnogynum Torr. ex Benth. (woolly fruit) Woolly-cup buckwheat. Plants hummock-forming and matlike, 0.5–1.5 dm tall, 0.5–3 dm wide. **STEMS** numerous, compact, aerial flowering stem 1–5 (6.5) cm long, silky-tomentose. **LEAVES** basal, 1 per node or fasciculate in terminal tufts; petiole 0.1–2.5 (3) cm long, tomentose to floccose; blade narrowly elliptic, 0.4–1.2 cm long, 1.5–3.5 cm wide, densely white or silvery tomentose on both sufaces; margins entire. **INFL** capitate (ours) or open and divided 1–3 times; bracts 3, scalelike, triangular, 0.5–1.5 mm long, 0.5–2 mm wide; branches absent. **INVOLUCRES** broadly campanulate, 2–5 per cluster, 2–3.5 mm long, 3–6 mm wide, tomentose; teeth 5, erect to spreading, 1–1.5 mm long. **FLOWERS** bisexual, nonstipitate, perianth yellow, 2.5–5 mm long, densely white-pubescent; tepals monomorphic, lanceolate to broadly lanceolate; stamens exserted, 3.5–5 mm long; filaments glabrous. **ACHENES** trigonous, brown to dark brown, 3–4 mm long, villous to tomentose. Widespread from northeastern Arizona and eastern Colorado to southwestern Kansas, western Oklahoma, and northern Texas. Our material belongs to **var. *sarahiae*** (N. D. Atwood & A. Clifford) Reveal (for Sarah Charley of Beclabito, New Mexico, a master weaver of Navajo rugs, as well as a sheepherder and herbalist). Limestone flats and mesa tops in piñon-juniper woodlands. ARIZ: Apa; NMEX: McK. 2285 m (7500'). Flowering: late June–July. A Four Corners endemic.

Eriogonum leptocladon Torr. & A. Gray. (thin or delicate stems) Sand wild buckwheat. Plants erect to spreading, diffusely branched shrubs, (2) 3–10 (12) dm tall, 5–15 (20) dm across. **STEMS** numerous; caudex stems spreading, often extensively so in moving sand; aerial flowering stems 0.3–1 dm long, mostly floccose to glabrate or glabrous, greenish to green. **LEAVES** cauline, not in fascicles; petiole 0.2–0.5 cm long; blade linear-lanceolate or linear-oblanceolate to narrowly oblong, 1.5–4 (6) cm long, 0.2–0.8 (1) cm wide, densely white-tomentose abaxially, less so and greenish adaxially; margin entire or infrequently somewhat revolute. **INFL** cymose, open, 5–40 cm long, 10–50 cm wide; branches white-tomentose to (more commonly) floccose and greenish, or occasionally glabrous and green, often with involucres racemosely arranged distally on branch tips; bracts 3, scalelike, 1–3 (6) mm long, 1–3.5 mm wide. **PEDUNCLES** absent. **INVOLUCRES** erect, turbinate to turbinate-campanulate, 1.5–3 mm long, 1–2 mm wide, tomentose to floccose or glabrous; teeth 5, erect, 0.4–0.7 mm long. **FLOWERS** bisexual, nonstipitate; perianth white (ours) or pale yellow to yellow, (2) 2.5–3.5 mm long, glabrous; tepals essentially monomorphic, oblong to broadly obovate, connate 1/4–1/3 their length; stamens slightly exserted, 2–4 mm long; filaments sparsely pilose proximally. **ACHENES** trigonous, light brown, 2.5–3.5 mm, glabrous except for minutely papillate beak. [*E. effusum* Nutt. subsp. *leptocladon* (Torr. & A. Gray) S. Stokes]. Sandy or infrequently gravelly or clayey flats, washes, and slopes in mixed grassland, saltbush, and sagebrush communities, and in piñon-juniper woodlands. 1280–2070 m (4200–6790'). Eastern Utah and northeastern Arizona east to southwestern Colorado and northwestern New Mexico. The yellow-flowered var. *leptocladon* occurs to our north in the San Rafael Desert of central eastern Utah.

1. Flowering stems and inflorescences essentially glabrous ..... **var. *papiliunculi***
1' Flowering stems and inflorescences tomentose to floccose ..... **var. *ramosissimum***

var. *papiliunculi* Reveal (of small butterflies, honoring Oakley Shields, b. 1941, who found a new butterfly on this plant) Butterfly wild buckwheat. Plants (3) 4–10 dm tall, 5–15 dm across. **FLOWERING STEMS** glabrous or nearly so. **LEAF BLADES** lanceolate to narrowly elliptic, 2.5–3.5 cm long, (0.4) 0.5–0.8 cm wide; margin entire, plane. **INFL** glabrous. **PERIANTH** white. White or red blow sand on flats, washes, and slopes in mixed grassland, blackbrush, and sagebrush communities, and in piñon-juniper woodlands. ARIZ: Apa, Nav; NMEX: SJn; UTAH. 1200–2140 m (3940–7020'). Central Utah south to northern Arizona.

var. ramosissimum (Eastw.) Reveal (full of small branches) San Juan wild buckwheat. Plants 2–8 dm tall, 5–15 dm across. **FLOWERING STEMS** white-tomentose. **LEAF BLADES** linear-lanceolate to narrowly oblong, 1.5–3 cm long, (0.2) 0.3–1 cm wide; margin plane to slightly revolute. **INFL** tomentose, rarely floccose. **PERIANTH** white. [*E. effusum* Nutt. subsp. *pallidum* (Small) S. Stokes; *E. pallidum* Small; *E. ramosissimum* Eastw.]. White or infrequently red blow sand on flats, washes, and slopes in mixed grassland, saltbush, and sagebrush communities, and in piñon-juniper woodlands. ARIZ: Apa, Nav; COLO: Mon; NMEX: San, McK, RAr, SJn; UTAH. 1280–2070 m (4200–6310'). Flowering: Jun–Oct. Eastern Utah and southwestern Colorado south to northeastern Arizona and northwestern New Mexico.

Eriogonum leptophyllum (Torr.) Wooton & Standl. (thin leaf, as to leaf blades) Slender-leaf wild buckwheat. Plants spreading to rounded subshrubs or shrubs, 2–8 (13) dm tall, (1) 3–15 (18) dm across. **STEMS** numerous; caudex stems mostly spreading; aerial flowering stems (0.05) 0.1–0.8 dm long, thinly pubescent or glabrous, green, yellowish green, or infrequently grayish. **LEAVES** cauline, occasionally in fascicles; petiole 0.05–0.1 cm long, thinly tomentose to floccose or glabrous; blade linear to linear-oblanceolate, (0.5) 2–6 cm long, (0.03) 0.1–0.3 cm wide, densely to thinly white-tomentose abaxially, thinly so to glabrous and green adaxially; margin entire, tightly revolute. **INFL** cymose, densely compact, (1) 2–12 (15) cm long, (1) 4–15 (30) cm wide; branches thinly pubescent or glabrous and green; bracts 3, scalelike, 1–4 mm long, 1–3 mm wide. **PEDUNCLES** lacking. **INVOLUCRES** narrowly turbinate, 2–4 (4.5) mm long, 1–2 mm wide, glabrous; teeth 5, erect, 0.3–0.7 mm long. **FLOWERS** bisexual, nonstipitate; perianth white to pinkish, 2.5–4 mm, glabrous; tepals essentially monomorphic, oblong to narrowly obovate, connate less than 1/4 their length; stamens long-exserted, 3–6 mm long; filaments subglabrous to sparsely puberulent proximally. **ACHENES** trigonous, brown, (2.5) 3.5–4 mm, glabrous. $n = 20$. Clay flats, slopes, and outcrops, mainly in mixed grassland and sagebrush communities, and in piñon-juniper or conifer woodlands. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1530–2300 m (5020–7545'). Flowering: Jul–Oct. Northeastern and southeastern Utah east to southwestern Colorado and northwestern New Mexico. Used as a "life medicine" by Ramah Navajo.

Eriogonum lonchophyllum Torr. & A. Gray (spear leaf, as to leaf shape) Spear-leaf wild buckwheat. Plants low, spreading to erect subshrubs or spreading herbaceous perennials, (1) 1.5–5 dm tall, 2–5 (8) dm across. **STEMS** few to many; caudex stems mostly spreading; aerial flowering stems spreading to erect, 0.3–3 dm long, glabrous (ours) or

rarely floccose to tomentose, remaining tomentose among leaves, grayish. **LEAVES** basal or cauline on the proximal 1/2 of stem, not in fascicles; petiole 0.5–2 cm, tomentose to floccose or glabrous; blade narrowly lanceolate or oblanceolate to elliptic, 1.5–7 (9) cm long, 0.2–2 cm wide, densely white-tomentose abaxially, sparsely tomentose to thinly floccose and grayish or glabrous and green adaxially; margin plane or occasionally crenulate. **INFL** cymose, dense to more commonly open, 2–25 × 2–20 cm; branches glabrous (ours), rarely floccose, grayish; bracts 3, scalelike, 1–3 mm long, 1–3 mm wide, occasionally foliaceous and 0.8–3 cm long. **PEDUNCLES** erect, straight, stout, 1–8 mm, glabrous, proximal, usually absent. **INVOLUCRES** 1 or 2–5 in a cluster, turbinate to turbinate-campanulate, 2.5–4 mm long, (1.3) 1.5–3.5 (4) mm long, glabrous; teeth 5, erect, 0.4–0.9 mm long. **FLOWERS** bisexual, nonstipitate; perianth white, 2–3.5 (4) mm, glabrous; tepals monomorphic, oblanceolate, elliptic to oblong, or obovate, connate 1/4–1/3 their length; stamens exserted, 2–4 mm long; filaments pilose proximally. **ACHENES** trigonous, light brown to brown, 2–3 mm, glabrous except (typically) for slightly papillate beaks. [*E. corymbosum* Benth. var. *humivagans* (Reveal) S. L. Welsh; *E. effusum* Nutt. subsp. *salicinum* (Greene) S. Stokes; *E. humivagans* Reveal; *E. lonchophyllum* var. *saurinum* (Reveal) S. L. Welsh; *E. nudicaule* (Torr.) Small subsp. *scoparium* (Small) S. Stokes; *E. nudicaule* subsp. *tristichum* (Small) S. Stokes; *E. salicinum* Greene; *E. saurinum* Reveal; *E. scoparium* Small; *E. tristichum* Small]. Heavy gumbo clay soil or (at higher elevations) sandy loam to gravelly or rocky soil on flats, slopes, and outcrops in mixed grassland, saltbush, blackbrush, and sagebrush communities, piñon-juniper and montane conifer woodlands. COLO: Arc, Dol, LPl, Mon; NMEX: RAr, San, SJn; UTAH. 1400–2900 m (4595–9515'). Flowering: Jun–Oct. Eastern Utah, western and central Colorado south to northern New Mexico.

Eriogonum microthecum Nutt. (small cup, as to the small involucre) Plants erect to spreading subshrubs or shrubs, rarely matted, 0.5–1.5 dm tall, 6–13 (16) dm wide. **STEMS** many, spreading to erect; caudex stems absent or spreading, occasionally matted; aerial flowering stems erect to spreading, slender, solid, not fistulose, 0.1–1 dm long, tomentose, floccose, or glabrous. **LEAVES** cauline, usually in fascicles; petiole 0.1–0.5 cm, tomentose to floccose or glabrous; blade mostly elliptic, sometimes linear to obovate, 0.3–3.5 (4) cm long, 0.1–2 cm wide, tomentose abaxially, less so or glabrous and greenish adaxially; margin entire, occasionally revolute. **INFL** cymose, compact, often flat-topped, 0.5–6 (12) cm long, 1–10 (13) cm wide; branches whitish- to brownish- or reddish-tomentose to floccose, infrequently green or gray and subglabrous or glabrous; bracts 3, scalelike, 1–5 mm long, 1–3 mm wide. **PEDUNCLES** mostly erect, straight, slender, 3–15 mm long, tomentose to floccose, usually absent distally. **INVOLUCRES** turbinate, (1.5) 2–3.5 (4) mm long, 1.3–2.5 (3) mm wide, tomentose or glabrous; teeth 5, erect, (0.3) 0.5–1 (1.7) mm long. **FLOWERS** bisexual, nonstipitate; perianth yellow or white, becoming orange or rose to red, 1.5–3 (4) mm long, glabrous; tepals connate 1/5–2/5 their length, essentially monomorphic, oblong to obovate; stamens mostly exserted, 2.5–4 mm; filaments sparsely to densely puberulent proximally. **ACHENES** trigonous, brown, 1.5–3 mm, glabrous. Widespread throughout most of the western United States from Washington to Montana south to southern California, northern Arizona, and northern New Mexico. A species of 13 varieties; the two most common ones are in our area.

1. Leaf margins plane, flowering stems and inflorescences floccose or glabrous; just entering our area in San Juan County, Utah ..... **var. *laxiflorum***
1'. Leaf margins revolute or nearly so; flowering stems and inflorescences tomentose to floccose; common and widespread in our area ..... **var. *simpsonii***

var. *laxiflorum* Hook. (loose leaf, as to the well-spaced cauline leaves) Great Basin wild buckwheat. Plants shrubs, (1) 2–4 (5) dm tall, 3–8 dm wide. **FLOWERING STEMS** 0.2–0.6 (0.8) dm long, floccose or tomentose, rarely glabrous. **LEAF BLADES** mostly elliptic, (0.5) 1–2 (2.5) cm long, (0.1) 0.2–0.6 (0.8) cm, densely to sparsely whitish tomentose abaxially, less so to sparsely whitish floccose adaxially; margin not revolute. **INFL** (1) 2–4 (8) cm long and wide; branches floccose to glabrate, rarely glabrous. **INVOLUCRES** 2–3 (3.5) mm long, subglabrous, glabrous or floccose between angled ridges. **PERIANTH** white to pink or rose, 2–3 mm long. **ACHENES** 2–3 mm long. [*E. confertiflorum* Benth.; *E. microthecum* subsp. *confertiflorum* (Benth.) S. Stokes; *E. microthecum* subsp. *laxiflorum* (Hook.) S. Stokes]. Sandy to gravelly flats and slopes in mixed grassland, saltbush, blackbrush, and sagebrush communities, piñon-juniper and montane conifer woodlands. ARIZ: Apa, Nav; UTAH. 1750–2315 m (5735–7600'). Flowering: Jun–Oct. Washington to Montana south to east-central California, north-central Arizona, southern Utah, and northwestern Colorado.

var. *simpsonii* (Benth.) Reveal (Lieutenant James Harvey Simpson, 1813–1883, U.S. Topographical Engineers, co-discoverer of Chaco Canyon during Navajo Expedition to New Mexico in 1849) Simpson's wild buckwheat. Plants subshrubs to shrubs, (1) 2–15 dm tall, 4–16 dm across. **FLOWERING STEMS** erect or nearly so, 0.2–0.7 dm long, densely lanate to tomentose, sometimes floccose or rarely glabrous, whitish to grayish. **LEAF BLADES** mostly narrowly elliptic, 0.5–1.8 (2.5) cm long, 0.1–0.2 cm wide, densely white-tomentose abaxially, mostly white-floccose or rarely

glabrous and green adaxially; margins usually revolute; petioles 1–5 mm long. **INFL** (1.5) 2–4 (6) cm tall and wide; branches tomentose to floccose or rarely glabrate, grayish to greenish. **INVOLUCRES** 2–3 mm long, tomentose to floccose or glabrate. **PERIANTH** white, becoming pink to rose, 2–3 mm. **ACHENES** 2–3 mm long. [*E. effusum* Nutt. var. *foliosum* Torr. & A. Gray; *E. effusum* subsp. *nelsonii* (L. O. Williams) S. Stokes; *E. microthecum* var. *foliosum* (Torr. & A. Gray) Reveal; *E. microthecum* var. *friscanum* (M. E. Jones) S. Stokes; *E. microthecum* var. *macdougalii* (Gand.) S. Stokes; *E. simpsonii* Benth.] Clayey to gravelly or occasionally sandy washes, flats, and slopes in mixed grassland, saltbush, blackbrush, and sagebrush communities, and in piñon-juniper woodlands or infrequently in montane conifer woodlands. ARIZ: Apa, Coc, Nav; COLO: Arc, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1400–2300 m (4595–7545′) Flowering: Jun–Oct. Southeastern California east across central and southern Nevada through Utah and northern Arizona to southwestern Wyoming, western and south-central Colorado, and northern New Mexico.

Eriogonum ovalifolium Nutt. **CP** (oval-leaved) Cushion wild buckwheat. Plants low, pulvinate, herbaceous perennials, 0.5–3 dm tall, 2.5–4 dm across. **STEMS** numerous; caudex stems matted, compact to somewhat spreading; aerial flowering stems scapose, mostly erect, 0.4–2 dm long, tomentose, whitish, grayish, greenish, or tawny. **LEAVES** basal; petiole 1–10 cm long, mostly tomentose; blade spatulate, oblong or obovate to oval or round, 0.5–2 cm long, 0.4–1.5 (2) cm wide, tomentose, sometimes less so to floccose and whitish to grayish or tawny adaxially. **INFL** capitate, 1.5–3.5 cm across; bracts 3, scalelike, 0.8–4 mm long, 0.5–3 mm wide. **PEDUNCLES** absent. **INVOLUCRES** turbinate, 3.5–5 mm long, 2–4 mm wide, tomentose to floccose; teeth 5, erect, 0.4–1 mm. **FLOWERS** bisexual, nonstipitate; perianth white to cream or pinkish, rose, red, or purplish, 4–5 mm, glabrous; tepals dimorphic, those of the outer whorl mostly oval to orbicular, 2–4 mm long and wide, those of the inner whorl oblanceolate to elliptic, 3–5 mm long, 0.8–1.5 mm wide; stamens mostly included, 1–3 mm; filaments pilose proximally. **ACHENES** trigonous, light brown to brown, 2–3 mm long, glabrous. $n = 20$. Sandy to gravelly flats, washes, slopes, and ridges in mixed grassland, saltbush, and sagebrush communities, and in piñon and/or juniper and montane conifer woodlands. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: RAr, SJn; UTAH. 1525–2285 m (5000–7500′). Flowering: Apr–Aug. Widespread in western North America from southwestern Canada south to northern Arizona and New Mexico. *Eriogonum ovalifolium* is a variable species of some 11 varieties found mainly to the north and west of us. Our material, as described here, is **var. *purpureum*** (Nutt.) Durand (purple, as to color of some flowers in fruit). [*Eucycla purpurea* Nutt.; *Eriogonum purpureum* (Nutt.) Benth.; *E. orthocaulon* Small; *E. ovalifolium* subsp. *purpureum* (Nutt.) S. Stokes]. The var. *ovalifolium* (with yellow flowers) occurs just to our north. Used by the Ute for an unspecified purpose.

Eriogonum palmerianum Reveal (Edward Palmer, 1831–1911, archaeological, zoological, and botanical collector in the southwestern United States and Mexico) Palmer's wild buckwheat. Plants low, spreading to erect annuals, (0.5) 1–3 dm high. **STEMS** few, mostly erect, mostly floccose to tomentose, grayish to tawny. **LEAVES** basal; petioles 1–4 cm, floccose; blade suborbicular to cordate, 0.5–1.5 (1.8) cm long, 0.5–2 cm wide, densely white to grayish tomentose abaxially, less so to glabrate and often greenish adaxially; margin entire, plane. **INFL** cymose, distally uniparous due to suppression of secondary branches, forming open crowns, 10–30 cm; branches mostly few, floccose to tomentose, spreading to outwardly curved; bracts 3, scalelike, 0.5–3 mm long, 1–3 mm wide. **PEDUNCLES** absent. **INVOLUCRES** appressed to branches, campanulate, 1.5–2 mm long and wide; teeth 5, erect, 0.2–0.3 mm long. **FLOWERS** bisexual, nonstipitate; perianth white to pink or rarely pale yellowish, becoming red, 1.5–2 mm long, glabrous; tepals dimorphic, those of the outer whorl narrowly obovate and narrowly fan-shaped, those of the inner whorl oblanceolate; stamens included, 1–1.5 mm long; filaments pilose proximally. **ACHENES** trigonous, brown, 1.5–1.8 mm long, glabrous. $n = 20$. Sandy to gravelly washes, flats, and slopes in saltbush, greasewood, blackbrush, and sagebrush communities, and in piñon and/or juniper woodlands. ARIZ: Coc, Nav; COLO: Mon; UTAH. 1125–1525 m (3700–5000′). Flowering: Mar–Oct. Eastern California east across Nevada, Arizona, and western and southern Utah to western New Mexico.

Eriogonum polycladon Benth. (many branches, as to the highly branched inflorescence) Plants erect annuals, (0.5) 1–6 dm tall. **STEMS** mostly 1, erect, (0.3) 1–3 dm long, tomentose. **LEAVES** cauline; petioles 0.3–1.5 cm long, tomentose; blade narrowly oblanceolate to broadly elliptic, (0.7) 1–3 cm long, 0.5–1.5 cm wide, densely tomentose and whitish to grayish on both surfaces; margin entire, plane or slightly crisped. **INFL** virgate, narrow and strict, (5) 10–50 cm long, 5–25 cm wide; branches tomentose; bracts 3, scalelike, 1.5–3 mm long, 1–2.5 mm wide. **PEDUNCLES** absent. **INVOLUCRES** turbinate, 1.5–2.5 mm long, 1–2 mm wide, tomentose; teeth 5, 0.4–1 mm long. **FLOWERS** bisexual, nonstipitate; perianth white to pink or red, (1) 1.5–2 mm long, glabrous; tepals dimorphic, those of outer whorl obovate and broadly fan-shaped, those of inner whorl oblanceolate; stamens included, 1–1.5 mm long; filaments pilose proximally. **ACHENES** trigonous, dark brown, 1–1.3 mm long, glabrous. $n = 13$. [*E. densum* Greene; *E. vimineum* Douglas ex Benth. subsp. *polycladon* (Benth.) S. Stokes; *E. vimineum* var. *densum* (Greene) S. Stokes]. Sandy to gravelly

washes, flats, and slopes in saltbush, greasewood, blackbrush, and sagebrush communities, and in oak and piñon and/or juniper or occasionally montane conifer woodlands. ARIZ: Apa, Nav; NMEX: McK, San, SJn. 1125–2150 m (3700–7055'). Flowering: Sep–Oct. Arizona, New Mexico, and western Texas south to northern Mexico, disjunct and probably introduced but now extirpated in southeastern California. Locally weedy in places.

Eriogonum racemosum Nutt. (full of clusters, as to racemose inflorescence) Red-root wild buckwheat. Plants erect herbaceous perennials, 3–8 (10) dm tall, 0.5–1.5 dm across. **STEMS** usually 1; caudex stems compact; aerial flowering stems erect to slightly spreading, slender to stout, not fistulose, (1) 1.5–2.5 (3) dm long, tomentose to floccose (ours) or rarely glabrous, mostly grayish. **LEAVES** basal, not in fascicles; petiole (2) 3–10 (15) cm, tomentose to floccose; blade elliptic to ovate or oval to nearly rotund, (1.5) 2–6 (10) cm long, 1–4 (5) cm wide, lanate to thinly tomentose and grayish abaxially, floccose to glabrous and green adaxially; margin entire, plane. **INFL** cymose, virgate, or racemose, 15–50 cm long, 5–20 cm wide; branches tomentose (ours), rarely glabrous, with 5–20 (30) racemosely arranged involucres distally; bracts 3, scalelike, triangular and (1) 2.5–7 mm long, 1–4 mm wide, or foliaceous and linear-oblanceolate or oblanceolate to elliptic, 10–40 mm long, 5–20 (25) mm wide. **PEDUNCLES** erect, straight, stout, 3–40 mm, tomentose, often absent distally or occasionally entirely. **INVOLUCRES** turbinate-campanulate, (2) 3–5 mm long, (2) 2.5–4 mm wide, tomentose to floccose; teeth 5, erect, (0.1) 0.2–0.5 mm long. **FLOWERS** bisexual, nonstipitate; perianth white to pinkish, (2) 2.5–5 mm long, glabrous; tepals monomorphic, oblong; stamens exserted, 2–5 mm long; filaments pilose proximally. **ACHENES** trigonous, light brown, 3–4 mm long, glabrous. $n = 18$. [*E. racemosum* var. *obtusum* (Benth.) S. Stokes; *E. racemosum* var. *orthocladon* (Torr.) S. Stokes]. Sandy to gravelly flats and slopes in mixed grass, sagebrush, and mountain mahogany communities, and in scrub oak, piñon, juniper, and conifer woodlands. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1830–2900 m (6000–9515'). Flowering: Jun–Oct. Western Colorado, Utah, and southern Nevada south to northern Arizona and northwestern New Mexico. Kayenta Navajo used the plant for backaches and side aches. Ramah Navajo used an infusion of the whole plant for blood poisoning or internal injuries.

Eriogonum scabrellum Reveal (somewhat roughened, as to scabrellous stems and branches) Westwater wild buckwheat. Plants low to somewhat rounded, spreading annuals, 1–3 (5) dm high. **STEMS** mostly 1, erect, 0.5–1.5 dm long, floccose and scabrellous. **LEAVES** basal and sheathing up the stems 1–3 cm; petiole 1–4 (5) cm, floccose; blade cordate, 1–3 (4) cm long and wide, densely white-tomentose abaxially, sparsely floccose and greenish to green or reddish brown adaxially; margin crisped and wavy. **INFL** cymose, open, spreading, often flat-topped, 5–40 cm high, 20–100 dm wide; branches scabrellous; bracts 3, scalelike, 1–1.5 mm long, 0.4–0.9 mm wide. **PEDUNCLES** lacking. **INVOLUCRES** horizontal, turbinate, 1.5–2.5 mm long, 1.5–2 mm wide, scabrellous; teeth 5, erect, 0.4–0.6 mm. **FLOWERS** bisexual, nonstipitate; perianth white, becoming pink to rose or deep red in fruit, 1–1.5 mm, minutely pustulose; tepals dimorphic, those of the outer whorl obovate with truncate bases, those of the inner whorl ovate; stamens excluded, 1–1.5 mm long; filaments glabrous. **ACHENES** trigonous, light brown to brown, 2 mm long, glabrous. $n = 20$. Clayey to gravelly washes, flats, and slopes in saltbush, blackbrush, and sagebrush communities, and in piñon-juniper woodlands. ARIZ: Apa; COLO: Mon; NMEX: SJn; UTAH. 1400–2300 m (4595–7545'). Flowering: Aug–Nov. Colorado Plateau of northwestern and southwestern Colorado and eastern Utah south into northeastern Arizona and northwestern New Mexico.

Eriogonum shockleyi S. Watson (William Hillman Shockley, 1855–1925, mining engineer and botanical collector in Nevada and eastern California) Shockley's wild buckwheat. Plants low, caespitose to pulvinate-matted, herbaceous perennials, 0.3–0.5 (0.7) dm tall, (0.5) 1–4 (10) dm across. **STEMS** numerous; caudex stems matted, compact; aerial stems scapose, erect or nearly so, (0.5) 1–3 cm long, floccose to tomentose, greenish or grayish, infrequently absent. **LEAVES** basal, not in fascicles; petiole 0.2–0.5 cm long, tomentose to floccose; blade oblanceolate to elliptic or spatulate, (0.2) 0.3–0.8 (1.2) cm long, 0.2–0.4 (0.6) cm wide, tomentose to floccose and whitish to grayish or tawny on both surfaces, infrequently greenish; margin entire, plane. **INFL** capitate, 0.8–2 cm across; branches absent; bracts 3–5, ± scalelike, linear to linear-lanceolate, 1.5–4 mm long, 0.6–1 mm wide. **PEDUNCLES** absent. **INVOLUCRES** campanulate, (2) 2.5–5 (6) mm long, 3–6 (7) mm wide, tomentose; teeth 5–10, sometimes ± lobelike, erect to spreading, (0.5) 1–3 mm long. **FLOWERS** bisexual, nonstipitate; perianth white to rose (ours) or yellow, 2.5–4 mm long, densely pilose; tepals monomorphic, oblong to obovate; stamens exserted, 2.5–5 mm long; filaments subglabrous to sparsely pilose proximally. **ACHENES** trigonous, light brown to brown, 2.5–3 mm long, tomentose. [*E. pulvinatum* Small; *E. shockleyi* subsp. *candidum* (M. E. Jones) S. Stokes; *E. shockleyi* subsp. *longilobum* (M. E. Jones) S. Stokes; *E. shockleyi* var. *longilobum* (M. E. Jones) Reveal]. Gravelly or clayey (rarely sandy) flats, washes, and slopes in saltbush, blackbrush, and sagebrush communities, and in piñon-juniper woodlands. ARIZ: Apa, Coc, Nav; COLO: Mon; NMEX: McK, SJn; UTAH. 1370–2135 m (4500–7000'). Flowering: May–Aug. Great Basin and Colorado Plateau, eastern California, southern

Idaho, Nevada, Utah, and western Colorado south to northern Arizona and northwestern New Mexico. Our plants form small, compact mats not more than 4 dm across and generally have spreading, lobelike involucral teeth.

Eriogonum subreniforme S. Watson (somewhat kidneylike, as to leaf shape) Kidney-shaped wild buckwheat. Plants tall, erect to slightly spreading annuals, 1–5 (7) dm high. **STEMS** mostly 1, (0.2) 0.5–1.5 dm long, not fistulose, glabrous except floccose to glabrescent near leaves, usually greenish. **LEAVES** basal; petiole (1) 2–6 cm, mostly floccose; blade reniform to orbicular, (0.5) 1–3.5 (4) cm long, (0.5) 1–4 (5) cm wide, densely white-tomentose abaxially, hirsute to floccose or glabrous and greenish adaxially; margin entire, plane. **INFL** cymose, open to slightly diffuse, 5–40 (50) cm long, 5–35 cm wide; branches glabrous, greenish; bracts 3, scalelike, 1–3 mm long, 1.5–2.5 mm wide. **PEDUNCLES** erect or nearly so, straight, filiform, 5–25 mm long, glabrous or rarely floccose at or before anthesis. **INVOLUCRES** turbinate, 0.5–1 mm long, 0.6–0.9 mm wide, glabrous; teeth 5, erect, 0.2–0.4 mm. **FLOWERS** bisexual, nonstipitate; perianth white to rose or rarely yellowish, 0.6–1.6 (2) mm long, glabrous or sparsely hirsute; tepals monomorphic, lanceolate to spatulate or elliptic to ovate; stamens included to slightly excluded, 0.7–1.4 mm long; filaments glabrous. **ACHENES** trigonous, light to dark brown, 1.7–2 mm long, glabrous. [*E. filicaule* S. Stokes]. Sandy to gypsophilous or clayey flats and slopes in saltbush, greasewood, and blackbrush communities, and in oak and piñon-juniper woodlands. ARIZ: Apa, Nav; NMEX: McK, SJn. 1370–2100 m (4500–6890'). Flowering: Apr–Oct. Southwestern Utah, northern Arizona, and northwestern New Mexico.

Eriogonum umbellatum Torr. (having an umbel, as to inflorescence) Sulphur flower. Plants low, caespitose, matted, herbaceous perennials to large spreading shrubs, 1–12 (20) dm tall, 3–12 (20) dm across. **STEMS** numerous; caudex stems matted to spreading; aerial flowering stems erect or nearly so, arising at nodes of caudex and at distal nodes of short, nonflowering aerial stems, (0.3) 0.5–3 (4) dm long, tomentose to floccose or glabrous, greenish to green. **LEAVES** in loose to compact basal rosettes; petioles 0.1–3 (4) cm long, tomentose to floccose, rarely glabrous; blades elliptic to round, 0.3–3 (4) cm long, 0.2–3 cm wide, tomentose to thinly floccose or glabrous on one or both surfaces; margins entire, plane. **INFL** umbellate to compound umbellate, 3–25 cm long, 2–18 cm wide; branches tomentose to floccose or glabrous; bracts 3–several, semifoliaceous at first node, 3–15 mm long, 2–10 mm wide, mostly scalelike and 1–5 mm long, 0.5–3 mm wide distally. **PEDUNCLES** mostly absent. **INVOLUCRES** turbinate to campanulate, 1–6 mm long, (1) 1.5–10 mm wide, tomentose to floccose or glabrous; teeth 6–12, lobelike, reflexed, 1–4 (6) mm long. **FLOWERS** bisexual or unisexual, often polygamodioecious, stipitate; perianth yellow, cream to red, or purple, 2.5–12 mm long including the (0.7) 1.3–2 mm long stipe, glabrous; tepals monomorphic, mostly spatulate to obovate, connate 1/4–1/3 their length; stamens exserted, 2–8 mm; filaments pilose proximally. **ACHENES** trigonous, light brown to brown, 2–7 mm, glabrous except for sparsely pubescent beak. Southern Canada south to southern California, northern Arizona, and northern New Mexico. A large and complex species with more than 40 varieties. Kayenta Navajo used the plant (probably var. *subaridum*) as a fumigant.

1. Inflorescences compound umbellate ..... **var. *subaridum***
1' Inflorescences umbellate or capitate ..... (2)

2. Leaf blades tomentose abaxially; plants mainly below 2500 m (8200') ..... **var. *umbellatum***
2' Leaf blades glabrous on both surfaces; plants mainly above 2500 m (8200') ..... **var. *porteri***

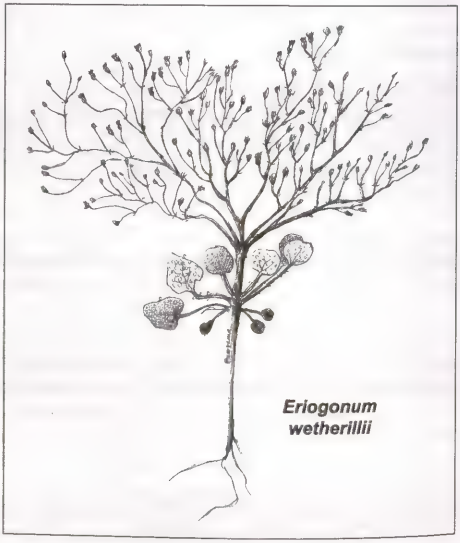
var. *porteri* (Small) S. Stokes (Thomas Conrad Porter, 1822–1901, professor of botany and zoology at Lafayette College, Pennsylvania, and occasional collector in Colorado) Plants caespitose to a low subshrub, 0.2–0.6 dm tall, 1–5 dm across. **FLOWERING STEMS** erect, 0.1–0.5 dm long, floccose to nearly glabrous. **LEAVES** in tight rosettes; blade elliptic to spatulate, 0.4–1.1 cm long, 0.3–0.8 cm wide, glabrous on both surfaces. **INFL** umbellate and subcapitate to capitate; branches less than 0.5 cm long, glabrous. **INVOLUCRAL TUBES** 2–3 mm long; lobes 2–3 mm long, reflexed. **PERIANTH** bright yellow, 3–6 mm long. [*E. porteri* Small]. Rocky slopes and ridges, high-elevation sagebrush and meadow communities, subalpine and alpine communities. COLO: Hin, LPl. 2400–3700 m (7875–12140'). Flowering: Jul–Sep. Mainly in the Rocky Mountains of Colorado, with disjunct populations in the Uinta and Wasatch mountains of Utah and in scattered ranges in central and northeastern Nevada.

var. *subaridum* S. Stokes [somewhat like subsp. *aridum* (var. *dicrocephalum*), a related variety] Ferris' sulphur flower. Plants mostly low to rounded subshrubs or shrubs, 2–7 dm tall, 3–9 (12) dm across. **FLOWERING STEMS** erect, (0.5) 1–2 dm long, floccose to glabrous. **LEAVES** in loose rosettes; blade elliptic, 1–3 cm long, 0.5–2 cm wide, thinly floccose on both surfaces or glabrous adaxially, rarely glabrous on both surfaces or tomentose abaxially. **INFL** compound umbellate, divided 2–5 times, floccose or glabrous. **INVOLUCRAL TUBES** 2–3 (3.5) mm long; lobes 1–3 mm long,

spreading to slightly reflexed. **PERIANTH** bright yellow, 3–7 mm long. [*E. biumbellatum* Rydb.; *E. umbellatum* subsp. *ferrissii* (A. Nelson) S. Stokes; *E. umbellatum* subsp. *subaridum* (S. Stokes) Munz]. Sandy to gravelly flats and slopes in mixed grassland, saltbush, and sagebrush communities, and in oak, piñon-juniper, and montane conifer woodlands. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; UTAH. 1525–2590 m (5000–8500′). Flowering: Jun–Oct. Southern California east across southern Nevada and northern Arizona to Utah and southwestern Colorado.

var. *umbellatum* Common sulphur flower. Plants compact mats 1–3.5 dm tall, 2–6 dm across. **FLOWERING STEMS** erect, mostly 1–3 dm long, tomentose to floccose. **LEAVES** in loose rosettes; blades mostly elliptic to ovate, 1–2.5 (3) cm long, 0.5–1.5 (2) cm wide, white- to gray-lanate or -tomentose abaxially, less so to floccose or more commonly glabrous and green adaxially. **INFL** umbellate; branches 0.3–2.5 (10) cm long, floccose. **INVOLUCRAL TUBES** 2–3 mm long; lobes 1.5–3 mm long, strongly reflexed. **PERIANTH** bright yellow, 4–7 (8) mm long. Sandy to gravelly flats and slopes in mixed grassland and sagebrush communities, and in scrub oak and montane conifer woodlands. COLO: Arc, Dol, LPl, Mon, SMg; NMEX: RAr; UTAH. 1525–2590 m (5000–8500′). Flowering: Jun–Sep. Eastern Idaho and western Montana south through western and southern Wyoming into southeastern Utah and southern Colorado.

Eriogonum wetherillii Eastw. (Benjamin Alfred Wetherill, 1861–1950, rancher, who, along with brother Richard, 1858–1910, located Mesa Verde in 1888 and guided Alice Eastwood in 1895) Wetherill's wild buckwheat. Plants low, spreading annuals, 0.5–2.5 dm high. **STEMS** mostly numerous, 0.1–0.5 dm long, not fistulose, glabrous except villous near leaves, usually reddish. **LEAVES** basal; petioles 1–5 cm, tomentose to floccose; blade oblong to orbicular, (0.5) 1–4 cm long, (0.5) 1–3 cm wide, densely white-tomentose abaxially, floccose to glabrate and reddish or greenish adaxially; margin entire, plane. **INFL** cymose, flat-topped to spreading or rounded, diffuse, 5–20 cm long, 10–35 cm wide; branches glabrous, greenish or reddish; bracts 3, scalelike, 0.5–2 mm long, 1–2 mm wide. **PEDUNCLES** erect, straight, filiform, (3) 5–10 mm long, rarely absent distally. **INVOLUCRES** turbinate, (0.3) 0.5–1 mm long, (0.2) 0.5–1 mm wide, glabrous; teeth 4, erect, 0.1–0.3 mm long. **FLOWERS** bisexual, nonstipitate; perianth yellowish to red and 0.5–1.5 mm, glabrous; tepals monomorphic, elliptic to obovate; stamens included to slightly excluded, 0.7–1 mm long; filaments glabrous. **ACHENES** lenticular, dark brown to black, 0.6–1 mm long, glabrous. [*E. filiforme* L. O. Williams; *E. sessile* S. Stokes ex M. E. Jones]. Sandy to clayey flats, washes, and slopes in saltbush, greasewood, and blackbrush communities, and in oak and piñon and/or juniper woodlands. ARIZ: Apa, Coc, Nav; COLO: Mon; NMEX: SJn; UTAH. 1125–1980 m (3700–6500′). Flowering: Apr–Oct. Colorado Plateau: southeastern Utah and southwestern Colorado south to northeastern Arizona and northwestern New Mexico.



Eriogonum wetherillii

Eriogonum wrightii Torr. ex Benth. (Charles Wright, 1811–1885, western collector on numerous boundary and railroad surveys) Bastard-sage. Plants spreading to rounded subshrubs or shrubs, (1) 1.5–5 (7.5) dm tall, 1–12 (18) dm across. **STEMS** numerous; caudex stems absent; aerial flowering stems erect to spreading, (0.1) 0.5–4 (6) dm long, tomentose, whitish. **LEAVES** cauline, usually in fascicles; petiole 0.2–0.5 (1) cm long, tomentose to floccose; blade oblanceolate to elliptic, 0.5–1.5 cm long, 0.2–0.5 (0.7) cm wide, tomentose to floccose on both surfaces; margin entire, plane. **INFL** virgate or nearly cymose with racemosely arranged involucres distally, usually diffuse, 5–15 cm long, 10–20 cm wide; branches tomentose to floccose; bracts 3, mostly scalelike, 0.5–3.5 mm long and wide. **PEDUNCLES** absent. **INVOLUCRES** turbinate, 2–2.5 mm long, 1–2 mm wide; teeth 5, erect, 0.3–1 mm long. **FLOWERS** bisexual, nonstipitate; perianth white to pink or rose, 2.5–3.5 mm long, glabrous; tepals monomorphic, obovate; stamens exserted, 2.5–4 mm long; filaments usually sparsely pilose proximally. **ACHENES** trigonous, light brown to brown, 2.5–3 mm long, glabrous. [*E. trachygonum* Torr. ex Benth. subsp. *wrightii* (Torr. ex Benth.) S. Stokes]. Gravelly to rocky (often calcareous) slopes in mixed grassland, saltbush, and blackbrush communities, and in oak or piñon and/or juniper woodlands. ARIZ: Apa, Nav; NMEX: SJn. 1525–2200 m (5000–7215′). Flowering: Jul–Oct. Southeastern California across southernmost Nevada

to western Texas, south to central Mexico. Our plants, as described here, are **var. *wrightii***. Kayenta Navajo used the plant as an emetic.

Eriogonum zionis J. T. Howell (for Zion Canyon, Utah) Zion wild buckwheat. Plants erect to slightly spreading, herbaceous perennials, 3–8 (10) dm high, 0.5–1.5 dm across. **STEMS** usually 1; caudex stems compact; aerial flowering stems erect to slightly spreading, usually fistulose, 1–2.5 (3) dm long, glabrous (ours), rarely tomentose, greenish. **LEAVES** basal, not in fascicles; petiole 3–6 (10) cm, tomentose to floccose; blade elliptic or oblong to ovate, 2–4.5 (6) cm long, 1.5–2.5 (5) cm wide, lanate to densely tomentose abaxially, thinly floccose to glabrous and green adaxially; margin plane, entire. **INFL** narrowly cymose, virgate, or racemose, 20–50 (60) cm long, 5–25 cm wide; branches glabrous (ours), rarely tomentose, with (8) 10–15 (20) racemosely arranged involucres distally; bracts 3, scalelike, triangular and 2–7 mm long, or foliaceous and elliptic, 10–25 mm long, 5–12 mm wide. **PEDUNCLES** absent. **INVOLUCRES** erect, turbinate to turbinate-campanulate, 1.5–3 mm long, 1.5–2.5 mm wide, tomentose; teeth 5, erect, 0.2–0.4 mm long. **FLOWERS** bisexual, nonstipitate; perianth white to yellow, 2–3.5 (4) mm long, glabrous; tepals monomorphic, oblong; stamens exserted, 2–5 mm; filaments pilose proximally. **ACHENES** trigonous, light brown, 3–4 mm, glabrous. $n = 20$. [*E. racemosum* Nutt. var. *nobilis* S. L. Welsh & N. D. Atwood; *E. racemosum* var. *zionis* (J. T. Howell) S. L. Welsh]. Deep sandy soil in sagebrush communities. UTAH. 1310 m (4300'). Flowering: Jul–Oct. Southern Utah south to north-central Arizona. Our plants, as described here, are **var. *zionis*** and are known from a single location near Bluff, Utah.

Fallopia Adans. False-buckwheat

Rodney Myatt

(for Gabriello Fallopio, 1532–1562, an Italian anatomist) Plants annual or perennial vines or herbs; roots fibrous or woody; rhizomes occasionally present. **STEMS** erect to scandent, rarely procumbent, glabrous or pubescent; flowering stems branched. **LEAVES** cauline, alternate, petiolate; ocrea persistent or deciduous, chartaceous; blade broadly ovate to triangular, sometimes hastate or sagittate. **INFL** terminal or terminal and axillary, paniculate, racemose, or spicate; peduncles present or absent. **FLOWERS** bisexual or bisexual and unisexual, occasionally some plants pistillate, 1–5 per ocreate fascicle, stipitate proximally, pedicellate; perianth usually accrescent, pale green or white to pink, glabrous or (ours) with hyaline hairs; tepals 5, petaloid, connate proximally to nearly throughout, dimorphic; stamens 6–8; filaments distinct, free; styles 3, spreading, connate; stigma capitate, fimbriate, or peltate. **ACHENES** trigonous, brown to black, not winged, glabrous; embryo straight. $x = 10, 11$ (Freeman and Hinds 2005b; Kim, Park, and Park 2000). About 12 species of North America (8 species), South America, Eurasia, Africa, and scattered Pacific islands.

Fallopia convolvulus (L.) Á. Löve (bindweedlike) Black-bindweed. Plants annual vines, 5–10 dm long; rhizomes absent. **STEMS** scandent or sprawling, puberulent. **LEAVES** cauline; ocrea 2–4 mm long, glabrous or scabrid on margin; petiole 0.5–5 cm long, puberulent; blade broadly ovate with a cordate base, hastate or sagittate, 2–6 (15) cm long, 2–5 (10) cm wide, glabrous abaxially, scabrous adaxially with epidermal projections along veins. **INFL** axillary, erect or spreading, spicate, 2–10 (15) cm long; peduncle (0) 0.1–10 cm long, glabrous or scabrid. **FLOWERS** bisexual, 3–6 per ocreate fascicle; pedicel ascending to spreading, articulated distally, 1–3 mm long, glabrous or scabrid; perianth nonaccrescent, greenish white with a pinkish or purplish base, 3–5 mm long including stipe, glabrous or outer 3 with blunt, hyaline hairs; tepals elliptic to ovate, connate 1/3 their length, outer 3 obscurely keeled; stamens 8; anthers cream; styles connate distally; stigma capitate. **ACHENES** black, 4–6 mm long, dull, minutely granular. $n = 20$. [*Polygonum convolvulus* L.; *Bilderdykia convolvulus* (L.) Dumort.; *Reynoutria convolvulus* (L.) Shinners]. Weedy in dry fields and along roadsides, often climbing on fences and other structures. COLO: Arc; NMEX: SJn. 1615–1890 m (5300–6195'). Flowering: Jun–Aug. Introduced and widely naturalized throughout North America, South America, Africa, Australia, and Pacific Islands; native of Eurasia.

Oxyria Hill Mountain-sorrel

Rodney Myatt

(Greek *oxys*, sour, + *aria*, possession, alluding to acidic-tasting leaves) Plants synoecious, perennial herbs; roots thick, fleshy, fibrous; rhizomes present or absent. **STEMS** erect, glabrous; flowering stems unbranched. **LEAVES** basal, rarely cauline, alternate, petiolate; ocrea persistent or sometimes deciduous, chartaceous; blade reniform to cordate-orbicular. **INFL** terminal, paniculate or racemose; peduncles slender, erect or nearly so. **FLOWERS** bisexual, (1) 3–7 per ocreate fascicle, stipitate proximally, pedicellate; perianth nonaccrescent, greenish to reddish, glabrous; tepals 4, petaloid, distinct, dimorphic; margin entire or slightly wavy; tubercle absent; stamens 6; filaments distinct, free; styles 2, spreading, distinct; stigmas 2, penicillate. **ACHENES** lenticular, yellowish to tan, 2-winged, glabrous; embryo straight

or curved. $x = 7$ (Chrtek and Šourková 1992; Freeman and Packer 2005). About four species of Arctic and alpine areas in western North America (one species) and Eurasia. The "pedicel" length given here includes both the pedicel itself and the elongated stipe.

Oxyria digyna (L.) Hill. (two ovaries) Mountain-sorrel. Plants (3) 5–30 (50) cm tall. **LEAVES** basal; ocrea hyaline or brownish, 2.5–10 mm long, glabrous; petiole 1–15 cm long; blade reniform, (0.5) 1–6.5 cm long, 0.5–6 (8) cm wide. **INFL** (1) 2–20 cm long; peduncle 1–17 cm long. **FLOWERS** 2–6 per ocreate fascicle; pedicel (1) 3–5 mm long; perianth 1–2.5 mm long; tepals dimorphic, those of outer whorl lanceolate, 1.2–1.7 mm long, 0.5–1 mm wide, spreading in fruit, those of inner tepals broadly oblanceolate to ovate or orbicular, 1.4–2.5 mm long, 0.7–1.6 mm wide, appressed to fruit; stamens exserted, 1.5–2 mm long; anthers white to cream. **ACHENES** brown, 3–4.5 mm long, 2.5–5 mm wide including reddish or pinkish wings, dull, granular. $n = 7$. [*Rumex digynus* L.]. Rocky flats and slopes mainly in alpine communities, especially near melting snow. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 2895–3810 m (9500–12500'). Flowering: Jun–Aug. Greenland to Alaska, south to New Hampshire, south in the Rocky Mountains and the Sierra Nevada to California, Arizona, and New Mexico; Eurasia.

Persicaria Mill. Smartweed

Rodney Myatt

(Latin *persica*, peach, + *aria*, pertaining to, referring to leaf shape of some species) Plants annual or perennial herbs (ours), rarely suffrutescent; roots fibrous or woody; rhizomes or stolons sometimes present. **STEMS** erect or sometimes prostrate to scandent, glabrous or pubescent, rarely with recurved prickles; flowering stems usually branched. **LEAVES** mainly cauline, alternate, petiolate or sessile; ocrea persistent or disintegrating with age, usually deciduous entirely or distally, entire, tannish to brownish or reddish, charataceous or foliaceous, rarely coriaceous, glabrous or scabrous to variously pubescent; blade narrowly lanceolate to elliptic, ovate, hastate, or sagittate. **INFL** terminal or terminal and axillary, spicate, paniculate, or capitate; peduncle present. **FLOWERS** bisexual but functionally unisexual in some, 1–14 per ocreate fascicle, not stipitate proximally, pedicellate or not; perianth accrescent or nonaccrescent, white, greenish, pink, red, or purple, glabrous or glandular-punctate; tepals 4–5, petaloid, sometimes fleshy in fruit, connate 1/4–2/3 their length, dimorphic; stamens 5–8; filaments distinct or connate proximally, some occasionally adnate to perianth; styles 2–3, erect to spreading or reflexed; stigmas capitate. **ACHENES** lenticular or trigonous, brown to dark brown or black, not winged, glabrous; embryo curved. $x = 10, 11, 12$ (Hinds and Freeman 2005). About 100 species of both aquatic and terrestrial places, occasionally weedy, throughout North America north of Mexico (26 species) and nearly worldwide. All of our species belong to sect. *Persicaria*.

1. Plants perennial, of aquatic or subaquatic habitat; inflorescences terminal or nearly so, usually short and rather broad; flowers pink or red ..... ***P. amphibia***
1' Plants annual or rarely perennial, of terrestrial habitat, never floating; inflorescences terminal and axillary, usually elongate and narrow; flowers pink, white, or green ..... (2)

2. Ocrea with marginal ciliate hairs 1–12 mm long ..... (3)
2' Ocrea without marginal cilia or with hairs 1 mm long or less ..... (5)

3. Flowers not glandular-punctate ..... ***P. maculosa***
3' Flowers glandular-punctate ..... (4)

4. Achenes minutely granular, dull; cleistogamous flowers of sessile, axillary inflorescences sometimes enclosed by ocreae ..... ***P. hydropiper***
4' Achenes smooth, shiny; inflorescences not enclosed by ocreae ..... ***P. punctata***

5. Peduncle with yellowish glands; perianth mostly greenish white, with midvein of outer tepal anchor-shaped; inflorescence 3–8 cm long, arching or nodding ..... ***P. lapathifolia***
5' Peduncle with reddish purple glands; perianth mostly pink, with midvein of outer tepal not anchor-shaped; inflorescence 0.5–5 cm long, usually erect ..... ***P. pensylvanica***

Persicaria amphibia (L.) Gray (growing in water) Water smartweed. Plants perennial, floating to emergent, aquatic to terrestrial herbs, up to 30 dm tall in aquatic settings; rhizomes horizontal. **STEMS** prostrate to ascending or erect, often floating, glabrous or strigose to hirsute. **LEAVES** cauline; ocrea 0.5–5 cm long, with a smooth or ciliate margin (0) 0.1–3 (7) cm long, glabrous or pubescent to hirsute; blade without a triangular or lunate blotch adaxially, broadly

lanceolate to elliptic or narrowly oblong, (2) 4–15 (20) cm long, 1–6 (8) cm wide, the floating blades broader and longer than nonfloating ones, glabrous or slightly strigose, often coriaceous, minutely punctate; margin entire. **INFL** terminal, rarely axillary, ascending to erect, (1) 2–5 cm long, 0.8–1.5 (2) cm wide; peduncle 1–5 cm long, glabrous or variously pubescent, often stipitate-glandular. **FLOWERS** bisexual or functionally unisexual, 1–3 (4) per ocreate fascicle, heterostylous; pedicel ascending, 0.5–1.5 mm long; perianth dark pink to red, rarely white, 4–6 mm, glabrous, slightly accrescent; tepals 5, connate 1/3 their length, obovate to elliptic; stamens 5, included or exserted; anthers pink or red; styles 2, connate 1/2–2/3 their length. **ACHENES** brown, biconvex, 2–3 mm long, shiny or dull, smooth or minutely granular. $n = 33, 48, 66$. [*Polygonum amphibium* L.; *P. hartwrightii* A. Gray; *Persicaria natans* (Michx.) Eaton; *Pe. hartwrightii* (A. Gray) Greene]. Mostly aquatic in lakes, ponds, and streams, occasionally emergent in shallow waters or terrestrial in wet sites. ARIZ: Apa; COLO: Arc, Hin, LPl, Mon, SJn; NMEX: RAr, SJn. 1370–2975 m (4500–9760'). Flowering: Jun–Aug. Labrador to Alaska, south to Mexico; South America, Eurasia, Africa. Particularly robust, emergent plants with lanceovate leaves are sometimes recognized as the taxonomically dubious var. *emersa* (Michx.) J. C. Hickman [*P. coccinea* (Muhl. ex Willd.) Greene].

Persicaria hydropiper (L.) Spach (water pepper, a classical name of unknown meaning) Mild water-pepper smartweed. Plants annual, terrestrial herbs, (2) 4–8 (10) dm tall; rhizomes and stolons absent. **STEMS** decumbent, ascending to erect, glabrous, glandular-punctate. **LEAVES** cauline; ocrea (8) 10–15 mm long, with a ciliate margin bearing hairs 1–4 mm long, glabrous, or hispidulous, sometimes strigose, sometimes enclosing axillary inflorescences of mostly cleistogamous flowers; petiole (0) 0.1–0.8 cm long, glandular-punctate; blade without a triangular or lunate blotch adaxially, lanceolate to narrowly rhombic, (1.5) 4–10 (15) cm long, 0.4–2.5 cm wide, reduced distally, usually densely brownish and often with ciliate margins, glabrous or slightly scabrous on midvein. **INFL** terminal and axillary, erect or nodding, 3–18 cm long, 0.5–1 cm wide; peduncle (0) 1–5 cm long, glabrous, glandular-punctate. **FLOWERS** bisexual, 1–3 (5) per ocreate fascicle, homostylous; pedicel ascending, 1–3 mm long; perianth greenish proximally, white or pink distally, 2–3.5 mm long, glandular-punctate, scarcely accrescent; tepals (4) 5, connate 1/3 their length, obovate; stamens 6 (8), included; anthers pink to red; styles 2–3, connate proximally. **ACHENES** dark brown to brownish black, biconvex or trigonous, 2–3 mm long, dull, minutely granular. $n = 10$. [*Polygonum hydropiper* L.]. Weedy along moist ditches, streams, and lakesides. COLO: Mon, SJn; NMEX: SJn. 1525–1675 m (5000–5500'). Flowering: Jun–Aug. Introduced and widely naturalized from Newfoundland to Alaska, south to Mexico and Central America; native of Europe but widely introduced elsewhere in Asia, Africa, Australia, and on many Pacific islands.

Persicaria lapathifolia (L.) Gray (leaves like a sorrel) Dock-leaf smartweed. Plants annual, terrestrial herbs, (0.5) 1–10 dm tall; rhizomes and stolons absent. **STEMS** ascending to erect, glabrous, rarely appressed-pubescent distally, occasionally glandular-punctate or stipitate-glandular. **LEAVES** cauline; ocrea 4–25 (35) mm long, with a smooth or ciliate margin bearing hairs 1 mm long, glabrous, rarely strigose, not enclosing sessile, axillary inflorescences; petiole 0.1–1.6 cm long, glabrous or more often hispidulous to strigose; blade sometimes with a triangular or lunate blotch adaxially, narrowly to broadly lanceolate, (2) 4–12 (22) cm long, (0.3) 0.5–4 (6) cm wide, glabrous or tomentose abaxially, glandular-punctate adaxially, occasionally tomentose on both surfaces, strigose on main veins. **INFL** terminal and occasionally axillary, mostly arching or nodding at maturity, 3–8 cm long, 0.5–1.2 cm wide; peduncle 2–2.5 mm long, stipitate-glandular with yellowish glands. **FLOWERS** bisexual, 4–14 per ocreate fascicle, homostylous; pedicel ascending, 0.5–2.5 mm long; perianth greenish white to pink, 2.5–3 mm long, glabrous, glandular-punctate only on tube and inner tepals, scarcely accrescent; tepals 4 (5), connate 1/4–1/3 their length, obovate to elliptic; stamens (5) 6, included; anthers pink or red; styles 2 (3), connate proximally. **ACHENES** brown to black, discoid, rarely trigonous, 1.5–3 mm long, shiny or dull, smooth. $n = 11$. [*Polygonum lapathifolium* L.; *P. lapathifolium* var. *salicifolium* Sibth.; *P. nodosum* Pers.]. Wet habitats along streams, lakesides, and in wet meadows where occasionally weedy. ARIZ: Apa; COLO: Arc, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1525–2285 m (5000–7500'). Flowering: Jun–Aug. Throughout most of North America from Alaska to Greenland, to South America, Eurasia, Africa, and on scattered Pacific islands where introduced. The primary vein of each outer tepal is prominently bifurcate distally resulting in an anchor-shaped midrib. Plants with varying degrees of tomentum on the leaves have been segregated as varieties; none is accepted here. The characteristic nodding inflorescence is seen only in late anthesis and in fruit. Ramah Navajo prepared a cold infusion as a ceremonial chant lotion. Zuni used the plant as an emetic and cathartic drug.

Persicaria maculosa Gray, nom. cons. (spotted, as to leaf blade) Spotted lady's-thumb. Plants annual, terrestrial herbs, (0.5) 1–7 (13) dm tall; rhizomes and stolons absent. **STEMS** procumbent to ascending or erect, glabrous or appressed-pubescent. **LEAVES** cauline; ocrea 4–10 (15) mm long, with a ciliate margin bearing hairs 1–3.5 (5) mm

long, glabrous or strigose, not enclosing sessile, axillary inflorescences; petiole 0.2–2 cm long, glabrous or appressed-pubescent, occasionally strigose; blade often with a triangular or lunate blotch adaxially, lanceolate to narrowly ovate, (1) 5–10 (18) cm long, (0.2) 0.5–2.5 (4) cm wide, glabrous or appressed-pubescent, occasionally strigose, sometimes glandular-punctate abaxially. **INFL** terminal and axillary, erect, 1–4.5 (6) cm long, 0.7–1.2 cm wide; peduncle 1–5 cm long, glabrous or glandular-pubescent. **FLOWERS** bisexual, 4–14 per ocreate fascicle, homostylous; pedicel ascending, 1–2.5 (3) mm long; perianth greenish white proximally, dark pink distally, sometimes entirely pink to reddish or even purplish, 2–3.5 mm long, glabrous, scarcely accrescent; tepals (4) 5, connate 1/3 their length, oblong to obovate; stamens 4–8, included; anthers yellow or pink; styles 2 (3), connate proximally. **ACHENES** dark brown to black, discoid, biconvex or rarely trigonous, 2–2.7 mm long, shiny, smooth. $n = 11, 22$. [*Polygonum persicaria* L.]. Weedy in moist, open, disturbed places. COLO: Arc, LPl, Min; NMEX: McK, SJn. 1525–2135 m (5000–7000'). Flowering: Jun–Aug. Introduced and naturalized in Greenland to Yukon south to Mexico; Eurasia where both native and naturalized, also introduced in Africa and on scattered Pacific islands. Our plants, as described here, are **var. *maculosa***.

Persicaria pensylvanica (L.) M. Gómez (of Pennsylvania) Pinkweed. Plants annual, terrestrial herbs, 1–20 dm tall; rhizomes and stolons absent. **STEMS** ascending to erect, glabrous or appressed-pubescent distally, often stipitate-glandular distally. **LEAVES** cauline; ocrea 5–20 mm long, with a smooth or ciliate margin bearing hairs 0.5 mm long, glabrous or appressed-pubescent, not enclosing sessile, axillary inflorescences; petiole 0.1–2 (3) cm long, glabrous or appressed-pubescent; blade sometimes with a triangular or lunate blotch adaxially, narrow to broadly lanceolate, 4–20 (23) cm long, (0.5) 1–5 cm wide, glabrous or appressed-pubescent, glandular-punctate at least abaxially and sometimes adaxially. **INFL** terminal and axillary, erect or rarely nodding, 0.5–5 cm long, 0.5–1.5 cm wide; peduncle 1–5.5 (7) cm long, glabrous or pubescent, often stipitate-glandular with reddish purple glands. **FLOWERS** bisexual, 2–14 per ocreate fascicle, homostylous; pedicel ascending, 1.5–4.5 mm long; perianth greenish white to dark pink, 2.5–5 mm long, glabrous, accrescent; tepals 5, connate 1/4–1/3 their length, obovate to elliptic; stamens 6–8, included; anthers pink to red; styles 2 (3), connate proximally. **ACHENES** dark brown to black, discoid or rarely trigonous, slightly indented on one side, 2–3.5 mm long, shiny, smooth. $n = 44$. [*Polygonum pensylvanicum* L.; *P. omissum* Greene]. Open, moist, disturbed places where occasionally weedy. COLO: LPl, Mon; NMEX: McK. 1525–2135 m (5000–7000'). Nova Scotia to Minnesota, south to Florida and Mexico; disjunct and introduced in Alaska, Ecuador, England, Spain, and probably elsewhere. Our plants consistently have stipitate-glandular peduncles.

Persicaria punctata (Elliott) Small (glandularly spotted) Dotted smartweed. Plants annual or perennial, terrestrial herbs, 1.5–12 dm tall; rhizomes slender; stolons absent. **STEMS** ascending to erect, glabrous, glandular-punctate; flowering stems branched. **LEAVES** mostly cauline; ocrea (4) 9–18 mm long, chartaceous, swollen proximally, with a ciliate margin bearing hairs 2–11 mm long, glabrous or strigose, glandular-punctate, not enclosing sessile, axillary inflorescences; petiole 0.1–1 cm long, glandular-punctate; blade without a triangular or lunate blotch adaxially, lanceolate to broadly lanceolate or nearly rhombic, 4–10 (15) cm long, 0.6–2.5 cm wide, glabrous or scabrous, glandular-punctate. **INFL** terminal, sometimes also axillary, erect, 5–20 cm long, 0.4–0.8 cm wide; peduncle 3–6 cm long, glabrous, glandular-punctate. **FLOWERS** bisexual, 2–6 per ocreate fascicle, homostylous; pedicel ascending, 1–4 mm long; perianth greenish proximally, white distally, rarely tinged with pink, 3–3.5 mm long, glandular-punctate, scarcely accrescent; tepals 5, connate 1/3 their length, obovate; stamens 6–8, included; anthers pink or red; styles 2–3, connate proximally. **ACHENES** black, usually trigonous, (1.8) 2–3 mm long, shiny, smooth. $n = 22$. [*Polygonum punctatum* Elliott]. Along lakes and streams, in marshes, and on floodplains. ARIZ: Nav. 1370–1675 m (4500–5500'). Flowering: Jun–Aug. British Columbia to Nova Scotia south throughout the United States to South America; disjunct in Hawaii. None of the numerous varieties proposed for this species can be justified taxonomically.

Polygonum L., nom. cons. Knotweed

Rodney Myatt

(Greek *poly*, many, + probably *gone*, seeds, rather than *gony*, knee) Plants annual, biennial, or perennial herbs (ours) or subshrubs; roots fibrous or woody; rhizomes and stolons absent. **STEMS** prostrate to erect, glabrous, smooth or sometimes minutely scabrous; flowering stems branched. **LEAVES** cauline, alternate, rarely opposite, petiolate or sessile; ocrea distally persistent but otherwise disintegrating into fibers or completely deciduous, usually hyaline, 2-lobed, white or silvery, chartaceous, glabrous; blade linear to nearly round, entire. **INFL** axillary or axillary and terminal, spicate or as solitary flowers; peduncle absent. **FLOWERS** bisexual, 1–7 (10) per ocreate fascicle, not stipitate proximally; pedicels present or absent; perianth nonaccrescent, white or greenish white to pink, glabrous; tepals 5,

petaloid or sepaloid, connate proximally or up to 3/4 their length, monomorphic or rarely dimorphic; stamens 3–8, occasionally some reduced to staminodes; filament distinct, free or adnate to perianth; styles (2) 3, spreading; stigmas capitate. **ACHENES** lenticular or trigonous, light brown to black, not winged, glabrous; embryo curved. $x = 10$ (Costea, Tardif, and Hinds 2005). About 65 species found nearly worldwide including North America north of Mexico (33 species), of which many are introduced and weedy. As noted in the key, the introduced and aggressive weed *P. argyrocoleon* may be found in our area.

1. Stems generally sharply 4-angled especially near nodes, ribs obscure or absent; petiole articulated to ocrea; leaf venation parallel, secondary veins obscure; anthers pink to purple; achenes of one size and forming during summer; natives in natural habitats (sect. *Duravia* S. Watson) ..... (2)
1' Stems more or less rounded, 8–16 ribs on stem somewhat elevated and distinct; petiole articulated to proximal part of ocrea; leaf venation pinnate, secondary veins obvious; anthers whitish yellow; achenes of two sizes, summer achenes brown, smooth or tuberculate, fall achenes olivaceous, 2–5 times longer, and smooth; native or adventive weeds of disturbed sites (sect. *Polygonum*) ..... (5)

2. Achenes 1.3–1.7 mm long, yellow to greenish brown; stamens 3 ..... ***P. kelloggii***
2' Achenes 1.8–4.5 mm long, black; stamens (3) 8 ..... (3)

3. Leaves ovate to elliptic or nearly round, not reduced distally ..... ***P. minimum***
3' Leaves linear to oblanceolate, reduced distally ..... (4)

4. Pedicels reflexed; achenes 3–4.5 mm long; inflorescences spicate ..... ***P. douglasii***
4' Pedicels erect; achenes 2.5–3 mm long; inflorescences racemose ..... ***P. sawatchense***

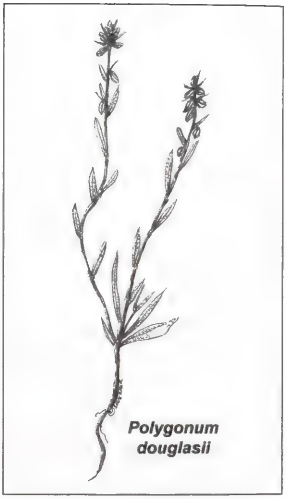
5. Flowers axillary throughout stem; stems generally prostrate to ascending, forming loose to rather compact mats; leaves flat, with lateral veins more or less distinct ..... ***P. aviculare***
5' Flowers mostly in upper 1/2 of stems; inflorescence appearing somewhat terminal; leaves reduced upward, bractlike, often absent within the inflorescence; stems mostly erect ..... (6)

6. Tepal margins pink; achenes 1.3–2.3 mm long; pedicels 1–2 mm long, hidden by ocrea; stamens 8; introduced and often weedy, to be expected in our area ..... *P. argyrocoleon* Steud. ex Kunze
6' Tepal margins greenish yellow or yellow, occasionally white or pink; achenes (2.3) 2.5–3.5 mm long; pedicels 2.5–6 mm long, exserted beyond ocrea; stamens 3–6; native, not weedy ..... ***P. ramosissimum***

Polygonum aviculare L. (small bird) Yard knotweed. Plants annual, homophyllous. **STEMS** prostrate to ascending, generally forming mats, (0.5) 1–5 (10) dm long, glabrous, several branches from base, round with evident ribs. **LEAVES** articulated to proximal part of ocrea; ocrea 3–12 mm long, glabrous, distally disintegrating into straight fibers or completely deciduous; petiole 0.3–3 mm long; blades pinnately veined with obvious secondary veins, green, oblanceolate to narrowly elliptic or elliptic, (0.6) 0.8–2.5 (3.5) cm long, (0.15) 0.2–0.7 (1) cm wide, distally reduced and bractlike, often overtopping flowers. **INFL** axillary, uniformly distributed or aggregated at tips of branches. **FLOWERS** closed, 2–7 per ocreate fascicle; pedicel 1–2.5 mm long, hidden by ocrea; perianth green or reddish brown with white margins, (1.8) 2–3.5 (4) mm long; tepals not keeled, petaloid, oblong, connate about 1/2 their length, midvein unbranched; stamens 5–7; anthers whitish yellow. **ACHENES** slightly exserted beyond perianth, light to dark brown, lenticular or trigonous, 1.5–4 (summer) or 2–5 (fall) mm long, dull, usually coarsely striate or obscurely tuberculate. $n = 20, 30$. [*P. arenastrum* Boreau]. Fields, roadsides, waste places, and disturbed, open habits. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, Hin, LPl, Mon, SJn; NMEX: McK, RAr, San, SJn; UTAH. 1220–3050 m (4000–10000'). Flowering: Jul–Sep. Introduced and naturalized throughout North America and nearly worldwide. Our plants, as described here, are the naturalized weed **var. *depressum*** Meisn. (low, as to stature); native to Europe. Additional varieties are to be expected in our area. Ramah Navajo took a warm infusion of the entire plant for stomachache.

Polygonum douglasii Greene (David Douglas, 1798–1834, Scottish botanical explorer in North America) Douglas' knotweed. Plants annual, homophyllous. **STEMS** erect, 5–8 dm long, glabrous or sparsely minutely scabrous, simple or branched, 4-angled, not ribbed. **LEAVES** articulated directly to ocrea; ocrea 6–12 mm long, glabrous or minutely scabrous, distally lacerate; petiole 0.1–2 mm long; blade 1-veined, green to dark green, linear to oblanceolate or narrowly oblong, 1.5–5.5 cm long, 0.2–0.8 (–1.2) cm wide; margin revolute, smooth or minutely denticulate; apex acute to mucronate. **INFL** axillary and terminal, widely spaced. **FLOWERS** closed, 2–4 per ocreate fascicle; pedicel 2–6 mm long, mostly exserted beyond ocreae; perianth green or tannish with white or pink margins, 3–4.5 mm long; tepals not

keeled, petaloid, oblong, connate 1/4 their length, midvein branched; stamens 8; anthers pink to purple. **ACHENES** enclosed by perianth, black, trigonous, 3–4 (–4.5) mm long, shiny or dull, smooth or minutely tuberculate. [*P. douglasii* var. *montanum* Small; *P. montanum* (Small) Greene]. Open sites along trails, meadows, and in forest clearings. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, SJn; UTAH. 2135–2925 m (7000–9600'). Flowering: Jun–Sep. Yukon to Labrador south to California, Arizona, New Mexico, and Virginia.



Polygonum douglasii

Polygonum kelloggii Greene (Albert Kellogg, 1813–1887, founder of the California Academy of Sciences) Kellogg's knotweed. Plants annual, homophyllous. **STEMS** erect, 0.2–1.5 dm long, glabrous, branched, 4-angled, not ribbed. **LEAVES** articulated directly to ocrea; ocrea 4–8 mm long, glabrous, distally lacerate; petiole absent; blade inconspicuously 3-veined, green, linear, 0.7–4 cm long, 0.1–0.2 cm wide; margins flat or revolute, smooth; apex mucronate. **INFL** mostly terminal, crowded. **FLOWERS** closed, 1–3 per ocreate fascicle; pedicel (0) 0.1–2 mm long, hidden by ocreae; perianth white to pink or red, 1.5–2.5 mm long; tepals not keeled, petaloid, narrowly lanceolate, connate 1/3 their length, midvein unbranched; stamens 8; anthers pink to purple. **ACHENES** enclosed by perianth, light yellow to greenish brown, trigonous, 1.3–1.7 mm long, shiny, smooth or slightly reticulate. [*P. polygaloides* Meisn. subsp. *kelloggii* (Greene) J. C. Hickman]. Mountain meadows and dry montane slopes. COLO: Arc, Mon; NMEX: SJn; UTAH. 1830–2720 m (6005–8920'). Flowering: Jul–Sep. British Columbia to Saskatchewan south to California and New Mexico. Our plants, as described here, are **var. *kelloggii***, which occurs from British Columbia to Montana, south to California and New Mexico.

Polygonum minimum S. Watson (small, as to size of plant) Zigzag knotweed. Plants annual, homophyllous. **STEMS** prostrate to erect, 0.2–3 dm long, scabrous, simple or branched, 4-angled, not ribbed. **LEAVES** articulated directly to ocrea; ocrea 1–4 mm long, minutely scabrous, distally slightly lacerate; petiole 0.1–3 mm long; blade 1-veined, green, narrowly elliptic to ovate or nearly round, 0.6–2.5 cm long, 0.3–0.8 cm wide; margins flat, smooth, irregularly thickened or minutely denticulate; apex apiculate. **INFL** axillary, widely spaced, sometimes crowded near tips of branches. **FLOWERS** closed or somewhat opened, 1–3 per ocreate fascicle; pedicel 2–3 mm long, hidden by ocreae; perianth green with white or pink margins, 1.8–2.5 mm long; tepals not keeled, sepaloid, oblong, connate 1/4 their length, midvein unbranched; stamens 8; anthers pink to purple. **ACHENES** enclosed by perianth or tip just exserted, black, trigonous, 1.8–2.3 mm long, shiny, smooth. Subalpine to alpine flats and slopes, often on nearly barren soil. COLO: RGr, SJn. 3100–3250 m (10150–10600'). Flowering: Jun–Sep. Alaska, British Columbia, and western Alberta south through Idaho, Montana, and Wyoming to Nevada, Utah, and Colorado; disjunct in the Black Hills of South Dakota.

Polygonum ramosissimum Michx. (with many branches) Yellow-flowered knotweed. Plants annual, heterophyllous. **STEMS** ascending to erect, 3–20 dm long, glabrous, several branches from base, round with evident ribs. **LEAVES** articulated to proximal part of ocrea; ocrea 6–12 (15) mm long, glabrous, distally disintegrating into straight fibers; petiole 2–4 mm long; blade pinnately veined with obvious secondary veins, yellowish green, lanceolate to narrowly elliptic, rarely ovate, 3.5–7 cm long, 0.7–2 (3.5) cm wide, distally reduced and bractlike, occasionally overtopping flowers. **INFL** axillary and terminal, aggregated at tips of branches. **FLOWERS** closed, 2–5 per ocreate fascicle; pedicel 2.5–6 mm long, exserted beyond ocrea; perianth green with yellow or rarely white or pink margins, (2.5) 3–4 mm long; tepals not keeled, petaloid or sepaloid, elliptic to oblong, connate about 1/4 their length, midvein unbranched; stamens 3–6; anthers whitish yellow. **ACHENES** enclosed or exserted beyond perianth, dark brown, trigonous, 2.5–3.5 (summer) or 5–12 (fall) mm long, shiny or dull, smooth or obscurely tuberculate. $n = 30$. Disturbed places, occasionally on saline soils. COLO: Hin, LPl, Mon; NMEX: San, SJn; UTAH. 1530–2285 m (5025–7500'). Flowering: Jul–Sep. Widespread throughout much of North America north of Mexico. Our plants, as described here, are **var. *ramosissimum***. Ramah Navajo took a warm infusion of the entire plant for stomachache and as a "life medicine."

Polygonum sawatchense Small (Sawatch Mountains, Colorado) Sawatch knotweed. Plants annual, homophyllous. **STEMS** erect, 0.4–5 dm long, glabrous, simple or branched, 4-angled, not ribbed. **LEAVES** articulated directly to ocrea; ocrea 4–10 mm long, glabrous, distally fibrous; petiole 0.1–2 mm long; blade 1-veined, linear-lanceolate to oblanceolate or narrowly oblong, 1.5–4.5 cm long, 0.2–0.8 (1.2) cm wide; margin usually revolute, smooth; apex mucronate. **INFL** axillary or axillary and terminal, widely spaced. **FLOWERS** closed, (1) 2–4 per ocreate fascicle; perianth

1–4 mm long, enclosed in or sometimes exserted beyond ocreae; perianth greenish or infrequently reddish, with white or pink margins, (2.5) 3–3.5 mm long; tepals not keeled, petaloid or sepaloid, narrowly oblong to oblong, connate 1/4–1/3 their length, midvein mostly unbranched; stamens 3–8; anthers pink to purple. **ACHENES** enclosed by perianth, black, trigonous, 2.5–3.5 mm long, shiny, smooth. [*P. douglasii* Greene subsp. *johnstonii* (Munz) J. C. Hickman]. Open sites along trails and lakesides in montane forests. ARIZ: Apa, Nav; COLO: Arc, Dol, Min; NMEX: McK, RAr, SJn; UTAH. 1720–2745 m (5640–9000'). Flowering: Jun–Sep. British Columbia to Manitoba, south to Nebraska, California, Arizona, and New Mexico. Our plants, as described here, are **var. *sawatchense***, with a slightly constricted range from what is given above; they are closely related to and often confused with *P. douglasii*. Ramah Navajo used the plant as snuff for nose troubles.

Rumex L. Dock

Rodney Myatt

(classical Latin name for *Rumex*, probably from *rumo*, to suck, as in sucking leaves to relieve thirst) Plants synoecious or dioecious, occasionally polygamomonoecious, annual, biennial, or perennial herbs; roots a taproot or rootstock; caudex short or absent; rhizomes or stolons occasionally present. **STEMS** erect to ascending or decumbent to prostrate, glabrous or minutely papillose; flowering stems usually branched. **LEAVES** basal in a rosette and cauline or just cauline, alternate, petiolate at least on basal and lower cauline blades; ocrea persistent or partially deciduous, membranous; blade linear to elliptic or ovate to nearly orbicular, reduced distally. **INFL** terminal, occasionally terminal and axillary, paniculate; peduncle absent. **FLOWERS** bisexual or unisexual, (1) 4–30 per ocreate fascicle, stipitate proximally, pedicellate; perianth accrescent, usually winglike and distinctly veined in fruit, green, pinkish, or red, glabrous; tepals (5) 6, sepaloid, distinct, dimorphic; margin entire or erose to distinctly toothed; tubercle absent or 1–3, lanceolate to broadly ovate or rounded, about 1/3 width of tepals; stamens 6; filaments distinct, free; styles 3, spreading or reflexed, distinct; stigmas 3, fimbriate or plumose. **ACHENES** trigonous, tan or brown to black, unwinged or only weakly so, glabrous, dull or shiny; embryo straight. $x = 7, 8, 9, 10$ (Mosyakin 2005; Rechinger 1937; Sarkar 1958). Perhaps 200 species throughout North America north of Mexico (63 species) and most of the world. Many species are adventive weeds, and some are escaped garden plants. Correct identification depends on collections which include some portion of root or underground rhizome system, basal leaves if present, and mature fruits. The "pedicel" length given here includes both the pedicel itself and the elongated stipe.

1. Plants dioecious; leaf blade hastate, narrow; stem slender; pedicel articulated near base of tepals (subg. *Acetosella* (Meisn.) Rech. f.) ..... ***R. acetosella***
1' Plants synoecious, youngest flowers rarely seemingly staminate; leaf blade not hastate; stem generally stout; pedicel with or without articulation (subg. *Rumex*) ..... (2)

2. Leaves cauline, not developing a basal rosette (sect. *Axillares*) ..... ***R. triangulivalvis***
2' Leaves basal and cauline, developing a basal rosette (sect. *Rumex*) ..... (3)

3. Tubercles 1–3, usually enlarged and evident in fruit ..... (4)
3' Tubercles absent or not evident ..... (6)

4. Inner tepal margin with few and obscure teeth ..... ***R. crispus***
4' Inner tepal margin with evident teeth, 1 mm or longer ..... (5)

5. Inflorescence elongated, lax, and interrupted, glabrous; leaf blades narrowly elliptic to oblong or narrowly ovate ..... ***R. dentatus***
5' Inflorescence dense distally, interrupted only proximally, papillose; leaf blades lanceolate ..... ***R. fueginus***

6. Inner tepals (8) 11–25 (30) mm wide; root tuberous ..... ***R. hymenosepalus***
6' Inner tepals 4–8 (11) mm wide; root not tuberous ..... (7)

7. Plants with creeping rhizomes; inner tepals entire or minutely dentate near base; plants of subalpine habitats ..... ***R. densiflorus***
7' Plants with vertical rootstock; inner tepals entire or weakly erose; plants of often moist, shady, or disturbed habitats ..... ***R. occidentalis***

Rumex acetosella L. (a classic generic name meaning little sorrel) Common sheep sorrel. Plants dioecious, perennial, 1–4 dm tall, glabrous; rootstock slender, vertical; rhizomes creeping. **STEMS** erect or ascending, several from base, often reddish. **LEAVES** with ocrea 0.3–0.6 cm long, brownish proximally, silvery proximally, lacerate; petiole (0.3) 1–4

cm long; blade hastate and usually lanceolate to narrowly obovate, infrequently linear to narrowly lanceolate, 2–6 cm long, 0.3–2 cm wide, glabrous; margin entire, flat or nearly so. **INFL** terminal, upper 1/2–2/3 of stem, usually lax, narrowly to broadly paniculate. **PEDICELS** articulated near base of tepals, filiform, 1–3 mm long. **FLOWERS** unisexual, staminate and pistillate on different plants, (3) 5–8 (10) in whorls, 1.2–2 mm long; inner tepals not or only slightly enlarged, equaling or slightly wider than achene, margins entire; tubercles absent. **ACHENES** brown to dark brown, 0.9–1.5 mm long. n = 7, 14, 21. [*Acetosella vulgaris* (W. D. J. Koch) Fourr.]. Weedy in moist habitats, often in disturbed places. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: RAr, SJn. 2395–3310 m (7855–10860'). Flowering: Apr–Sep. Introduced and now widespread throughout North America; both native and naturalized in Eurasia, introduced almost worldwide. Our plants are the hexaploids (n = 21) native to the Mediterranean region, which are sometimes distinguished as subsp. *pyrenaicus* (Pourr. ex Lapeyr.) Akeroyd [*R. acetosella* subsp. *angiocarpus* (Murb.) Murb.]. This phase may be distinguished by accrescent inner tepals which hold the achene, a feature of dubious taxonomic significance.

Rumex crispus L. (curly, as to leaf margins) Curly dock. Plants synoecious, biennial or more often perennial, 4–10 (15) dm tall, glabrous or slightly papillose; rootstock fusiform, vertical; rhizomes absent. **STEMS** erect, stout, branched distal to middle, greenish to reddish. **LEAVES** basal and cauline, developing a basal rosette; ocrea 1–7 cm long, usually deciduous, tan, membranous; petiole (3) 5–10 (15) cm long; blade linear-lanceolate to lanceolate, (6) 10–30 (35) cm long, (1) 2–6 cm wide, glabrous, sometimes slightly papillose on veins; base cuneate to truncate or weakly cordate; margin entire or nearly so, strongly undulate and crisped. **INFL** terminal, distal 1/2 of stem, dense to open with interrupted clusters of flowers proximally, paniculate. **PEDICELS** articulated proximal 1/3, filiform, enlarged distally, (3) 4–8 mm long. **FLOWERS** bisexual, 10–25 in whorls, 3.5–6 mm long, 3–6 mm wide at maturity; inner tepals broadly ovate to nearly orbicular; margins entire or nearly so to weakly erose; tubercles (1–2) 3, 1 larger than the others, 1/3 or less the width of tepal, verrucose. **ACHENES** reddish brown, 2–3 mm long. n = 30. Mainly in disturbed, low-lying, wet meadows, pastures, or riparian borders. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 1615–3050 m (5300–10000'). Introduced and widespread in North America; Eurasia where both native and naturalized, now established throughout most of the world. A stimulant used for fainting by the Navajo. Used as a ceremonial emetic by the Ramah Navajo.

Rumex densiflorus Osterh. (densely flowered) Dense-flower dock. Plants synoecious, perennial, 5–10 dm tall, glabrous or faintly papillose; rootstock absent; rhizomes creeping, horizontal. **STEMS** erect, branched distally above middle, greenish or reddish. **LEAVES** basal and cauline, developing a basal rosette; ocrea 0.5–4 cm long, deciduous or partially persistent, tannish, membranous; petiole (1) 5–20 cm long; blade narrowly oblong to oblong, (20) 30–40 (50) cm long, 8–12 (18) cm wide, glabrous, papillose on veins; base cuneate to truncate; margins entire, flat. **INFL** terminal, distal 1/2 of stem, dense, narrowly paniculate. **PEDICELS** indistinctly articulated in proximal 1/3–1/2, filiform, not enlarged, (3) 6–16 (17) mm long. **FLOWERS** bisexual, 10–20 in whorls, 4–7 mm long, 4.5–6 mm wide at maturity; inner tepals broadly triangular to subcordate; margins entire, erose, or proximally denticulate; tubercles absent. **ACHENES** brown to reddish brown, 2.5–4 (4.5) mm long. n = 60. [*R. orthoneurus* Rech. f.; *R. pycnanthus* Rech. f.]. Along stream banks in subalpine and alpine communities. COLO: Arc, Hin, LPl, Mon. 2745–3200 m (9000–10500'). Nevada, Utah, and Colorado south to Sonora, Mexico.

Rumex dentatus L. (with teeth) Toothed dock. Plants synoecious, perennial, 2–7 (8) dm tall, glabrous or faintly papillose on leaf veins; rootstock fusiform, vertical; rhizomes absent. **STEMS** erect, often flexuous in inflorescence, branched, greenish or reddish. **LEAVES** basal and cauline, developing a basal rosette; ocrea 0.2–1 cm long, deciduous or partially persistent, tannish to reddish brown, membranous; petiole 5–20 cm long; blade usually narrowly elliptic to oblong or narrowly ovate, 3–8 (12) cm long, 2–5 cm wide, glabrous or faintly papillose at least on veins in some; base truncate to slightly cordate; margins entire, flat or weakly undulate. **INFL** terminal, distal 1/2 of stem, lax and interrupted, occasionally more dense distally, broadly paniculate. **PEDICELS** articulated proximal 1/3, filiform, enlarged distally, 2–5 mm long. **FLOWERS** bisexual, 10–20 in whorls, 3–6 mm long, 2–5 mm wide at maturity; inner tepals broadly triangular to deltoid; margins dentate with 2–4 (5), sharp teeth 1.5–4 (5) mm long on each side of the tepal; tubercles (1) 3, thick, about 1/3 width of tepal, distinctly verrucose. **ACHENES** reddish brown, 2–3 mm long. n = 20. Waste places, roadsides, and shores. ARIZ: Nav; NMEX: SJn; UTAH. 1125–1775 m (3700–5820'). Flowering: Jul–Aug. Introduced and widely naturalized in scattered locations mainly in the West; native of Europe, Africa, and tropical Asia; introduced elsewhere. Exactly which European variety we have has not been determined as the taxa there are unsettled.

Rumex fueginus Phil. (of the Fuegina region near Tierra del Fuego, Chile) American golden dock. Plants annual, rarely biennial, 1.5–6 dm tall, usually papillose especially in inflorescence; rootstock fusiform, vertical; rhizomes absent.

STEMS erect, rarely decumbent, branched distal 2/3, occasionally to near base. **LEAVES** basal and cauline, developing a basal rosette; ocrea 0.3–2 cm long, deciduous, occasionally partially persistent proximally, tannish, membranous; petiole 0–5 cm long, papillose; blade narrowly lanceolate to lanceolate, 0.5–25 (30) cm long, (1) 1.5–3 (4) cm wide, papillose at least abaxially; base nearly truncate; margins entire or nearly so, undulate and minutely crisped. **INFL** terminal, distal 1/2 of stem, dense distally, interrupted proximally, broadly paniculate. **PEDICELS** articulated at base or proximal 1/3, filiform, not enlarged, 3–7 (9) mm long. **FLOWERS** bisexual, 15–30 (40) in whorls, 1.5–2 mm long, 2–4.5 mm wide at maturity; inner tepals narrowly to broadly triangular; margins entire or subentire, more often dentate with 2–3 teeth 1–3 mm long on each side of tepal; tubercles 3, thin, about 1/4 width of tepal or less. **ACHENES** light brown, 1–1.5 mm long. $n = 20$. [*R. maritimus* of United States authors, not L.; *R. maritimus* var. *fueginus* (Phil.) Dusén]. Riparian borders, shorelines, and marginally wet habitats. NMEX: McK, RAr, SJn; UTAH. 1165– 2730 m (3830–8960'). Widespread in North and South America; introduced and uncommon in Europe. Some of our plants have entire or subentire inner tepals; these have been separated as **var. *athrix*** (H. St. John) Rech. f. Infusion of plant taken for blood, and seeds made into a mush and used for food by the Kayenta Navajo.

Rumex hymenosepalus Torr. (membranous tepals) Sand dock. Plants perennial, 2.5–10 dm tall, glabrous or faintly papillose; rootstock tuberous, vertical; rhizomes thick, horizontal. **STEMS** usually erect, branched above middle, greenish or reddish. **LEAVES** basal and cauline, developing a basal rosette; ocrea 0.5–4 (5) cm long, persistent, white or silvery white to tannish, membranous; petiole (1) 3–7 cm long; blade broadly lanceolate to elliptic or oblong, (5) 8–30 cm long, 2–8 (12) cm wide, glabrous or faintly papillose; base cuneate; margin entire, flat or faintly crisped. **INFL** terminal, distal 1/2 of stem, dense, narrowly paniculate. **PEDICELS** articulated proximal 1/3–1/2, filiform, not enlarged, 5–15 (20) mm long. **FLOWERS** bisexual, 5–20 in whorls, 10–25 mm long, 8–30 mm wide at maturity; inner tepals broadly cordate to orbiculate-cordate; margins entire; tubercles absent. **ACHENES** brown to reddish brown, 4–8 mm long. $n = 20$. [*Rumex hymenosepalus* var. *salinus* (A. Nelson) Rech. f.]. Sandy to rocky flats and low hills, occasionally in alkaline soil. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1500–2135 m (4920–7000'). Flowering: Apr–Aug. California, Montana, and Wyoming south to Texas and Mexico. Used by the Hopi as a cold remedy and as a dye. Used by the Navajo for medicine and the brown roots were boiled to make dye for yarn. Used as a "life medicine" by the Kayenta Navajo and a ceremonial medicine by the Ramah Navajo.

Rumex occidentalis S. Watson (from the West) Western dock. Plants synoecious, perennial, 5–10 (14) dm tall, glabrous or slightly papillose; rootstock fusiform, vertical or oblique; rhizomes absent. **STEMS** erect, stout, unbranched below inflorescence, greenish to reddish. **LEAVES** basal and cauline, developing a basal rosette; ocrea 0.5–4 (5) cm long, persistent or partially deciduous, white or dark tan, membranous; petiole (1) 3–10 cm long; blade narrowly lanceolate to broadly lanceolate or ovate-triangular, 10–35 cm long, 5–12 cm wide, glabrous, sometimes slightly papillose on veins; base cordate to truncate or rounded; margin entire, undulate or somewhat crisped. **INFL** terminal, distal 2/3 of stem, dense or open with interrupted cluster of flowers, paniculate. **PEDICELS** obscurely articulated proximal 1/3, filiform, not enlarged distally, 5–13 (17) mm long. **FLOWERS** bisexual, 12–25 in a cluster, 5–10 (12) mm long, 5–8 (11) mm wide at maturity; inner tepals much wider and longer than achene, ovate to triangular or orbiculate; margins entire or nearly so to slightly erose; tubercle absent. **ACHENES** reddish brown, 3–4.5 mm long. $n = 60$. [*R. aquaticus* L. var. *fenestratus* of southern Rocky Mountains references, not (Greene) Dorn; *R. aquaticus* subsp. *occidentalis* (S. Watson) Hultén]. Wet meadows and bogs or shallow water in montane forests. COLO: Arc, Hin, Min, Mon, SJn; NMEX: McK, RAr, McK; UTAH. 1825–3660 m (6000–12000'). Flowering: Apr–Sep. Alaska to Labrador south to California, Arizona, New Mexico, South Dakota, and Iowa.

Rumex triangulivalvis (Danser) Rech. f. (triangle-shaped tepals) White willow dock. Plants synoecious, perennial, (3) 4–10 dm tall, glabrous; rootstock stout, vertical; rhizomes creeping. **STEMS** ascending to erect, 1 to several axillary shoots from near base, greenish. **LEAVES** cauline, not developing a basal rosette; ocrea 0.3–2 cm long, persistent or partially deciduous, tan, membranous; petiole 0.5–3 cm, often indistinct; blade narrowly lanceolate, 6–17 cm long, 1–4 (5) cm wide, glabrous; base cuneate; margins entire, flat or undulate. **INFL** terminal and axillary, terminal 1/5–1/3 of stem, rather dense or somewhat interrupted, narrowly to broadly paniculate. **PEDICELS** articulated proximal 2/3, filiform, slightly thickened distally, 4–8 mm long. **FLOWERS** bisexual, 10–25 in whorls, (2) 2.5–3.5 (4) mm long, (2) 2.5–3 (3.5) mm wide at maturity; inner tepals distinctly enlarged, wider and longer than achene, broadly triangular; margins entire or faintly erose near base; tubercles (1) 3, thick, evident, lance-ovate, about 1/3 width of tepal, glabrous or minutely verrucose. **ACHENES** brown to reddish brown, 1.7–2.2 mm long. $n = 10$. [*R. salicifolius* Weinm. var. *triangulivalvis* (Danser) J. C. Hickman; *R. mexicanus* misapplied, not Meisn.]. Occasional along valleys and streams from desert scrub to montane conifer and aspen communities, sometimes weedy in waste places. COLO: Mon, SJn;

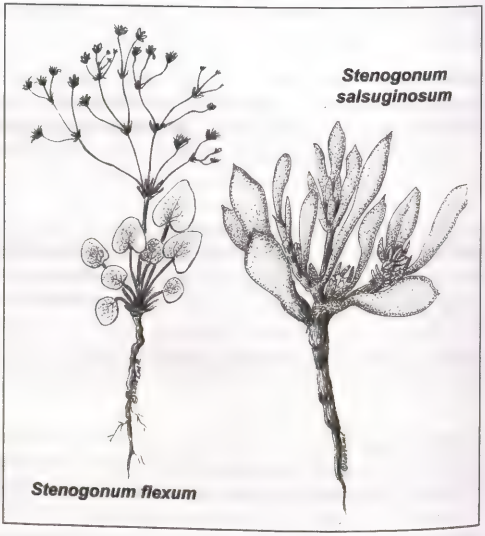
NMEX: SJn; UTAH. 1220–2440 m (4000–8000'). Thoughout much of North America (except the southeastern states) and Europe.

Stenogonum Nutt. Two-whorl Buckwheat
James L. Reveal

(Greek *stenos*, narrow, + *gonos*, seed, as to the slender achenes) Plants annual herbs; root a slender taproot. **STEMS** numerous, slender, glabrous, minutely strigose or glandular; caudex absent; aerial flowering stems spreading to somewhat erect, slender, solid, not fistulose, arising direct from a root. **LEAVES** basal or basal and cauline, alternate, estipulate, petiolate; blade narrowly lanceolate to oblanceolate or spatulate to orbicular, green and glabrous to sparsely and minutely strigose or glandular. **INFL** cymose; branches spreading, open to diffuse, mostly dichotomously branched, glabrous, minutely strigose or glandular; bracts scalelike, 3, connate proximally, proximal to node, not awned. **PEDUNCLES** ascending, straight or flexed, slender to capillary, glabrous. **INVOLUCRES** reduced to a series of 2 whorls, each of 3 lanceolate, foliaceous, bractlike lobes; lobes not awn-tipped. **FLOWERS** bisexual, (6) 9–15 per involucral cluster, not stipitate proximally, pedicellate; perianth nonaccresent, yellow, pilose; tepals 6, petaloid, lanceolate, monomorphic, entire apically; stamens 9; filaments adnate proximally, glabrous; anthers yellow, oval; styles 3, erect to spreading, distinct; stigmas capitate. **ACHENES** trigonous, light brown, not winged, glabrous; embryo curved. $x = 20$ (Reveal and Ertter 1977; Reveal 2005d). Two species, mainly on the Colorado Plateau.

1. Leaves basal; peduncle flexed; plants erect, sparsely glandular ..... ***S. flexum***
1' Leaves basal and cauline; peduncle straight; plants spreading, glabrous ..... ***S. salsuginosum***

Stenogonum flexum (M. E. Jones) Reveal & J. T. Howell (bent, as to the peduncle) Bent two-whorl buckwheat. Plants mostly erect, (0.5) 1–3 dm tall. **LEAVES** basal; petioles 1–4 cm long; blade mostly orbicular, 0.5–2 cm long and wide, minutely strigose when young, glabrous at maturity. **INFL** erect or slightly spreading, 0.5–2.5 dm long; branches glandular at nodes and lower internode, green to yellow-green; bracts 0.5–2 mm long, glabrous or sparsely glandular. **PEDUNCLES** erect to spreading, flexed, filiform, 1–3 cm long, glandular to middle. **INVOLUCRAL LOBES** 2–3 mm long, 2–4 mm wide, glabrous or sparsely glandular. **FLOWERS** yellow to reddish yellow, 1.5–3.5 mm long, pilose; tepals lanceolate; stamens 1.5–2 mm long. **ACHENES** 2–2.5 mm long. $n = 20$. [*Eriogonum flexum* M. E. Jones]. Clay hills and flats primarily in saltbush communities. ARIZ: Apa; COLO: Mon; NMEX: SJn; UTAH. 1350–2000 m (4430–6560'). Flowering: Apr–Sep. Primarily Colorado Plateau of eastern Utah, western Colorado, north-central Arizona, and northwestern New Mexico.



Stenogonum salsuginosum Nutt. (of salty places, as to habitat) Smooth two-whorl buckwheat. Plants mostly spreading, 0.5–2 dm tall. **LEAVES** basal and cauline, glabrous; petiole 0.5–2 cm long on basal blade, otherwise absent; basal blade spatulate, (1) 2–4 cm long, (0.5) 1–2.5 cm wide; cauline blade narrowly lanceolate to oblanceolate, 0.5–4.5 cm long, 0.2–1 cm wide. **INFL** spreading, 0.5–2.5 (3) dm long; branches glabrous, green; bracts 0.5–4 mm long, glabrous. **PEDUNCLES** erect to spreading, straight, slender to filiform, 0–4 cm long, glabrous, often absent distally. **INVOLUCRAL LOBES** 2–8 mm long, 2–3 mm wide, glabrous. **FLOWERS** yellow, 1.5–3 mm, pilose; tepals lanceolate; stamens 1.5–2 mm long. **ACHENES** 2–2.5 mm long. $n = 20$. [*Eriogonum salsuginosum* (Nutt.) Hook.]. Clay hills and flats primarily in saltbush communities. ARIZ: Apa, Nav; COLO: Mon; NMEX: McK, San, SJn; UTAH. 1300–2150 m (4265–7055'). Flowering: Apr–Sep. Primarily Colorado Plateau of southwestern Wyoming south through eastern Utah and western Colorado to northern Arizona and northwestern New Mexico.

PORTULACACEAE Juss. PURSLANE FAMILY

David J. Ferguson

Ours annual or perennial herbs; roots fibrous to tuberous. **STEMS** reduced to well developed, succulent, base sometimes suffrutescent and persistent. **LEAVES** opposite, subopposite, or alternate and sometimes secund, sometimes rosulate or subrosulate; fleshy to succulent, mostly entire, mostly glabrous; stipules none (*Portulaca* with nodal or axillary hairs sometimes regarded as stipular). **INFL** axillary or terminal, racemose, cymose, or with flowers solitary. **FLOWERS** mostly actinomorphic or slightly irregular; sepals 2 (–9); petals usually free, sometimes fused at extreme base, 5 (2–20); stamens 1–many, often opposite to petals, sometimes basally adnate to petals or each other; gynoecium 3 (2–9)-carpelled; ovary 1, superior (perigynous in *Portulaca*), 1-locular at maturity, placentation basal or free-central, ovules 1–many; style present, simple; stigma lobes 1–9. **FRUIT** a capsule, valvate or circumscissal. **SEEDS** smooth or sculptured, with or without investing testicular pellicle, strophioles, or elaiosomes. The family Portulacaceae as traditionally defined (excluding closely related satellite groups Basellaceae, Cactaceae, and Didiereaceae) consists of two distinct groups based on morphological and molecular evidence (Applequist and Wallace 2001) and might best be considered as two distinct families. Within the study area, *Portulaca* belongs to one group and the remaining genera to the other. *Montia chamissoi* (Ledeb. ex Spreng.) Greene, "miners-lettuce," has been found near the study area and is to be expected.

1. Leaf axils usually with hairs or bristles; ovary 1/2 inferior to inferior ..... ***Portulaca***
1' Lacking axillary hairs or bristles; ovary superior ..... (2)

2. Capsule circumscissile, valves longitudinally dehiscent from the base ..... ***Lewisia***
2' Capsule 2- or 3-valved, dehiscing from the apex ..... (3)

3. Sepals mostly deciduous; inflorescence not secund; leaves articulate at the base ..... ***Phemeranthus***
3' Sepals persistent; inflorescence somewhat to markedly secund; leaves not articulate at base ..... (4)

4. Cauline leaves 2 (–3), distinct or partially or completely connate; ovules 3 or 6 ..... ***Claytonia***
4' Cauline leaves more than 2, distinct; ovules 3 ..... *Montia chamissoi* (Ledeb. ex Spreng.) Greene

Claytonia L. Spring-beauty

(for John Clayton, British botanist, 1686–1773) Annual or perennial, succulent or semisucculent, glabrous herbs; roots various, mostly with thick taproot or bearing rounded tubers. **STEMS** reduced, thick, not well differentiated from rootstock. **LEAVES** basal, few to several in rosettes or clusters, petiolate, blade flat, mostly somewhat succulent. **INFL** scapose, racemose, or cymose; lowermost bracts paired, leaflike; uppermost bracts paired or more often single, small, mostly scarious. **FLOWERS** relatively showy; sepals persistent, foliaceous, unequal; petals 5; stamens 5, adnate to petal bases; ovary oblong to globose, ovules 3 or 6; style 1, often 3-lobed; stigma lobes 3. **FRUIT** a 3-valved capsule, longitudinally dehiscent from apex, sometimes explosively, valves not deciduous, margins involute. **SEEDS** 3–6, black, mostly orbicular, shiny and smooth to tuberculate, with white elaiosome; seeds dispersed ballistically and by ants. Approximately 26 species in North America and Asia; adventive elsewhere.

1. Numerous leaves crowded in a basal rosette from a thick, woody taproot, leaves thick, midrib often obscure, petiole short and ill-defined; inflorescences several, spreading laterally; alpine ..... ***C. megarhiza***
1' Few leaves, or 2 pairs on a scape, leaves relatively thin with ribs obvious, petiole prominent; 1 to few inflorescences; below alpine ..... (2)

2. Foliaceous bracts lanceolate to broadly lanceolate, prominently 3-ribbed; petals retuse to emarginate ..... ***C. lanceolata***
2' Foliaceous bracts linear to narrowly lanceolate, 1-ribbed or indistinctly 3-ribbed; petals rounded to acute at apex ..... ***C. rosea***

Claytonia lanceolata Pursh (lance-shaped, referring to the leaf) Western spring-beauty, lance-leaf spring-beauty. Herbaceous, succulent perennial, with globose, cormlike tubers 5–20 mm diameter. **LEAVES** in a basal cluster, 1–6, often absent on flowering tubers, 5–10 cm long; blade mostly shorter than petiole, linear to lanceolate, 2–6 × 0.6–2.5 cm. **INFL** 10–23 cm long, mostly 1–3 per tuber, racemose, 5–15-flowered, multibracteate; lower bracts leaflike, paired, sessile, ovate to narrowly lanceolate, 3–5-ribbed, 3–6 × 1–2 cm long; upper bract(s) unpaired, reduced to membranous ovate scales; pedicels 1–3 cm, recurved in fruit. **FLOWER** sepals elliptic to ovate, obtuse, 4–5 mm; petals white to pink

or magenta, often striped, 10–12 mm long, ovate, retuse to emarginate; ovules 6. **FRUIT** broadly ovoid, ca. 4 mm long. **SEEDS** orbicular, ca. 2 mm long, shiny dark brown to black; elaiosome 1–2 mm. $2n$ = 12, 16, 24, 32, 44, 48, 52, 54, 74, about 90. Piñon-juniper, mountain brush, aspen, ponderosa pine, and Douglas-fir communities. COLO: Arc, Dol, Hin, LPl, Min, Mon, SMg; NMEX: RAr; UTAH. 1980–2590 m (6500–8500'). Flowering: May–Jun. Widespread in mountainous areas, primarily west of the Continental Divide and south from southern Canada to Colorado, Utah, Nevada, and California. Pressed herbarium material is often difficult to determine between *C. lanceolata* and *C. rosea*, especially if key features are not represented.

Claytonia megarhiza (A. Gray) Parry ex S. Watson **CP** (large root) Alpine spring-beauty, big-root spring-beauty, fellfields claytonia. Herbaceous, succulent, rosulate perennial; rootstock stout, thick, roughly napiform, usually branching, semiwoody taproot. **LEAVES** in crowded basal rosette, succulent; petiole short, broad, winged; blade oblanceolate, obovate, rhomboid to spatulate, obtuse, 4–10 × 0.5–3 cm. **INFL** usually several, 5–15 (25) cm, spreading laterally to an ascending, corymbiform cyme; lower paired (rarely alternate) bracts sessile, unequal, oblanceolate to narrowly spatulate, 1–3 cm; upper bracts single, obtuse, subtending pedicels. **FLOWER** sepals 4–8 mm, unequal, ovate, broadly acute; petals white to rose-pink, 5–20 × 3–8 mm, obovate, slightly retuse, clawed; ovules 6. **FRUIT** ovoid, 4–6 mm. **SEEDS** 3–6, 2–2.5 mm long, rounded-oval, shiny, smooth, black; elaiosome 1 mm or less. $2n$ = 12, 16, 24, 32, 34, 36. Talus slopes in the alpine tundra. COLO: Arc, Con, Hin, LPl, Min, Mon, SJn. 3350–4115 m (11000–13500'). Flowering: Jun–Aug. Washington to Alberta, south to Nevada, Colorado, and New Mexico.

Claytonia rosea Rydb. (pink, for the flower color) Rose spring-beauty, Rocky Mountain spring-beauty. Herbaceous, succulent perennial, with globose, cormlike tubers 5–15 mm diameter. **LEAVES** (0) 1–6, in a basal cluster, petiole 5–10 cm long; blade about equal to petiole, mostly oblong, ovate, or spatulate, 1–7 × 0.4–2 cm, apex mostly obtuse. **INFL** 12–15 cm, racemose, mostly 5–10-flowered, multibracteate; lower bracts leaflike, paired, sessile, linear to linear-lanceolate, 1- or weakly 3-ribbed, 2–5 cm × 5–12 mm, apex acute to obtuse; upper bracts unpaired, reduced to membranous scales; pedicels 2–3 cm long, recurved in fruit. **FLOWERS** 8–14 mm diameter; sepals round-ovate, 3–5 mm long; petals pink to magenta, sometimes white or striped, obovate, rounded to acute, 8–10 mm; ovules 6. **FRUIT** ovoid, ca. 4 mm long. **SEEDS** orbicular, 2–3 mm long, shiny black; elaiosome 1–2 mm. $2n$ = 16. [*C. lanceolata* Pursh var. *rosea* (Rydb.) R. J. Davis]. Well-drained, shallow soils. Piñon-juniper, mountain brush, aspen, fir, lodepole pine, and spruce-fir communities. COLO: Arc, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1830–2895 m (6000–9500'). Flowering: Apr–Jun. Scattered populations in Arizona, New Mexico, Utah, and Colorado; Mexico. *Claytonia rosea*, along with several other putative species, is sometimes considered a variant of *C. lanceolata*; however, based on morphological distinctness and lack of intermediacy among wild populations, it is maintained as distinct here.

Lewisia Pursh Bitterroot, Lewisia

(for Captain Meriwether Lewis, of the Lewis and Clark Expedition, 1774–1809) Herbaceous, succulent perennials; rootstock usually a thick and fleshy taproot, gradually ramified distally, napiform or globose. **STEMS** occasionally well developed, succulent, slender (not our species); or thick, short, inconspicuous, not well differentiated as separate from rootstock, often subterranean, and usually obscured by densely crowded leaves. **LEAVES** succulent, deciduous (ours) to evergreen, mostly basal or basal and cauline; basal leaves tightly crowded in rosettes or appearing caespitose, variable from nearly terete to flat and broad, from entire to toothed or lobed, from epetiolate to long-petiolate. **INFL** scapose, cymose, or occasionally racemose or single-flowered; bracts persistent, usually small, mostly in subequal pairs, sometimes single, margins entire, toothed, or glandular-toothed, herbaceous or scarious. **FLOWERS** pedicellate or sessile; sepals persistent, 2 (–9), equal or subequal when paired, margins entire, toothed, or glandular-toothed, herbaceous or scarious; petals 5–20, mostly persistent after drying; stamens 1–50, distinct to scarcely connate and/or adnate to petals basally; ovules 1–50; style branched; stigma lobes 2–8. **FRUIT** caplike, dehiscent by circumscissal split near base, mostly splitting acropetally by partial longitudinal slits. **SEEDS** 1–50, brown or black, smooth or minutely sculpted; no pellicle, elaiosome, or strophiole. Approximately 16 species in mountainous regions of the western United States and Canada. The number of species in *Lewisia* is debated due to morphological variability and differing species concepts. Natural hybridization may occur between some species. In cultivation related species hybridize easily, and several species and hybrids are cultivated by alpine/rockery plant enthusiasts.

1. Leaves nearly terete; uppermost bracts 4–8 in a whorl, closely subtending sepals; flowers usually over 3 cm in diameter, mostly 1 per inflorescence; sepals 4–9; petals 10–20 ..... ***L. rediviva***
1′ Leaves roughly plano-convex; bracts paired or single; flowers under 3 cm in diameter; sepals 2; petals 5–10 .....(2)

2. Flowers usually solitary, mostly 2 cm or more diameter, slightly zygomorphic; sepal margins mostly entire, sometimes obscurely or irregularly toothed, not glandular, apex acute to subacute; petals white, rarely pinkish ..... ***L. nevadensis***

2' Flowers usually multiple per inflorescence, mostly under 2 cm diameter, actinomorphic, sepal margins regularly toothed, usually glandular-toothed (rarely ± entire), apex truncate or sometimes rounded, obtuse, subacute, or apiculate; petals mostly pink, rarely white ..... ***L. pygmaea***

Lewisia nevadensis (A. Gray) B. L. Rob. **CP** (of Nevada) Nevada bitterroot. Herbaceous, succulent perennial; rootstock napiform to short-fusiform. **STEMS** crowning and not obviously distinct from root, short, often subterranean, with leaves tightly crowded. **LEAVES** succulent, narrowly linear to linear-oblanceolate, dorsally flattened to slightly concave, gradually narrowed to broad petiole, 4–15 cm long, 2–6 mm wide, margins entire, apex obtuse to subacute; withering at or soon after anthesis. **INFL** with flowers solitary, rarely 2–3-flowered; bracts 2, opposite, linear-lanceolate, 6–18 mm long, margins entire, apex acute. **FLOWERS** slightly zygomorphic, usually appearing slightly laterally "pinched," 0.5–2 cm diameter; sepals 2, broadly ovate, 5–13 mm long, herbaceous at anthesis, margins entire or with few shallow, nonglandular teeth, apex acute to subacute; petals 5–10, white or rarely pinkish, elliptic to oblanceolate, 10–15 (-20) mm long; stamens 6–15; stigma lobes 3–6; pedicel 10–40 mm long. **FRUIT** 5–10 mm long, base persistent after dehiscence. **SEEDS** 20–50, 1.3 mm long, shiny, muricate. $2n = 56$. [*Calandrinia nevadensis* A. Gray; *Claytonia grayana* Kuntze; *Lewisia bernardina* Davidson; *L. pygmaea* (A. Gray) B. L. Rob. var. *nevadensis* (A. Gray) Fosberg; *Oreobroma nevadense* (A. Gray) Howell]. Near springs and wet, grassy slopes; upper piñon-juniper woodlands, ponderosa pine, and Douglas-fir communities. ARIZ: Apa; COLO: Arc, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 2135–2590 m (7000–8500'). Flowering: Apr–Aug. Washington to Idaho, south to California, Nevada, Utah, Colorado, Arizona, and New Mexico.

Lewisia pygmaea (A. Gray) B. L. Rob. (very small) Pygmy bitterroot, alpine bitterroot, alpine lewisia. Succulent, herbaceous perennial; rootstock fleshy, fusiform to narrowly napiform, usually branching apically. **STEMS** ± prostrate or suberect, becoming reflexed in fruit, 1–6 cm long. **LEAVES** basal, crowded, succulent, linear to linear-oblanceolate, plano-convex to slightly concavo-convex, occasionally nearly terete, no obvious petiole, blade linear to linear-lanceolate, 3–9 cm, margins entire, apex acute to obtuse. **INFL** 2–7-flowered cyme; lower bracts 2, opposite; upper bracts 1 subtending each flower, linear-oblong, linear-lanceolate, or lanceolate, 2–10 mm long, margins glandular-toothed, sometimes eglandular-toothed or nearly entire, apex acute; pedicel 2–10 mm. **FLOWERS** rotate, 1.5–2 cm diameter; sepals 2, suborbiculate, broadly ovate, or obovate, 2–6 mm, herbaceous at anthesis, margins usually glandular-toothed, sometimes eglandular-toothed or rarely ± entire, apex usually truncate, sometimes rounded, obtuse, subacute, or apiculate; petals 5–9, white, pink, or magenta, sometimes green at base, narrowly oblong, elliptic, or oblanceolate, 4–10 mm; stamens (4–) 5–8; stigma lobes 3–6. **FRUIT** 4–5 mm long, base persistent after dehiscence. **SEEDS** 15–24, 1–2 mm long, shiny, smooth. $2n$ = about 66. [*Talinum pygmaeum* A. Gray; *Calandrinia grayi* Britton; *C. pygmaea* (A. Gray) A. Gray; *Lewisia exarticulata* H. St. John; *L. glandulosa* (Rydb.) S. Clay; *L. minima* (A. Nelson) A. Nelson; *L. pygmaea* var. *aridorum* Bartlett; *L. pygmaea* subsp. *glandulosa* (Rydb.) R. S. Ferris; *L. sierrae* R. S. Ferris; *Oreobroma aridorum* (Bartlett) A. Heller; *O. exarticulatum* (H. St. John) Rydb.; *O. glandulosum* Rydb.; *O. grayi* (Britton) Rydb.; *O. minimum* A. Nelson; *O. pygmaeum* (A. Gray) Howell]. Mostly exposed bare places or in short turf, on gravelly or rocky substrates; aspen, spruce-fir, and alpine tundra. COLO: Arc, Con, Dol, Hin, LPl, Min, Mon, SJn; UTAH. 2300–4200 m (7500–13800'). Flowering: Apr–Aug. Southern Alaska to southern California, west to Montana, South Dakota, Colorado, Arizona, and New Mexico.

Lewisia rediviva Pursh (coming back to life, referring to the ability of a plant to grow after being dried) Bitterroot. Herbaceous, succulent perennial; rootstock thick, fleshy, roughly napiform, most often branching. **STEMS** procumbent to erect, 1–3 cm. **LEAVES** basal, withering at or soon after anthesis, sessile, blade linear to narrowly clavate, subterete to slightly concave above, 0.5–5 cm, margins entire, apex obtuse to subacute. **INFL** 1-flowered; bracts 3–8, whorled, subulate to linear-lanceolate, 4–10 mm, margins entire, apex acuminate; pedicel mostly 5–20 mm, disarticulating with flower remains and fruit at maturity. **FLOWERS** showy, sepals 4–9, imbricate, broadly elliptic to ovate, 10–25 mm long, scarious after anthesis, margins entire to somewhat erose, apex obtuse to rounded; petals 10–19, white or pink to magenta, sometimes pale in center or striped, elliptic, oblong, or narrowly oblanceolate, 15–35 mm; stamens 12–50, united at base; stigma lobes 4–9. **FRUIT** 5–6 mm long, ovoid. **SEEDS** 6–25, 2–2.5 mm long, orbicular-reniform, shiny dark brown to black, minutely tuberculate. $2n = 26, 28$. [*L. alba* Kellogg]. Exposed, often unconsolidated gravelly to rocky substrates; sagebrush, juniper, black sagebrush, and piñon-juniper woodland communities. UTAH. 1900–2450 m (6000–8000'). Flowering: Mar–May. Our material belongs to **var. *rediviva***. Alberta, British Columbia south to California,

east to Idaho, Montana, Nevada, and south to Utah and Arizona. Native Americans commonly harvested and ate the boiled or dried roots. Colonies are spectacular when in full flower.

Phemeranthus Raf. Fameflower, Rockpink, Sunbright

(Greek *ephemeros*, for living for one day, + *anthos*, flower) Herbaceous annuals or perennials, caulescent, glabrous; rootstock thickened, tuberous, often suffrutescent, horizontal to vertical, globose to fusiform, or branching. **STEMS** prostrate to erect, simple or branching, sometimes basally suffrutescent. **LEAVES** alternate, sessile, semiterete to terete, 1–3 mm wide, 1–10 cm long, succulent. **INFL** cymose; single- to many-flowered; with peduncles suberect, long, slender, and scapelike; or, 1- to few-flowered with peduncles lateral, short, and succulent, often not exceeding leaves. **FLOWERS** often showy, pedicellate, open 1–4 hours at various times of day or night depending upon species; sepals 2, opposite, scarious to foliaceous, deciduous after anthesis, or persistent into fruiting; petals 5 (10); stamens 5–many, distinct or with filaments basally shortly coherent in several clusters; anthers 2-locular, oblong; ovary normally 3-carpellate, placentation free-central; style 1; stigma lobes 3 (–5). **FRUIT** a capsule, mostly erect, usually longitudinally basipetally dehiscent, sometimes acropetally; valves rigid, deciduous or briefly persistent. **SEEDS** many, black or dark brown, compressed, nearly smooth or with raised concentric ridges, estrophiolate, circular-reniform, small, seed coat shiny, covered with pale white or gray, thin, translucent, chartaceous pellicle. $x = 12$. About 25 species. Temperate North America and western South America. *Phemeranthus* has been traditionally subsumed into the distantly related and very different, primarily subtropical to tropical genus *Talinum*. That genus is separable by numerous characters from *Phemeranthus*, including its flattened leaves with visible midribs, acropetally dehiscent pendent capsules with immediately deciduous valves, and in having the endocarp and exocarp differentiated and often physically separating at maturity.

1. Stems prostrate to procumbent; leaves short (mostly under 2.5 cm), crowded along stem and upturned; inflorescences short (mostly under 5 cm), mostly appearing axillary and spreading laterally, 1- to few-flowered, with at least lowest flowers among leaves ..... ***P. brevifolius***
1′ Stems erect; leaves longer (mostly over 2.5 cm), spreading equally around stem; inflorescence long (mostly over 5 cm), usually appearing terminal, erect, many-flowered, with lowest flowers usually above leaves ..... ***P. confertiflorus***

Phemeranthus brevifolius (Torr.) Hershkovitz (short-leaved) Canyonland fameflower, canyonland rockpink, small-leaf fameflower, small-leaf rockpink, pygmy fameflower. Herbaceous, succulent perennial, resembling *Sedum*; rootstock thickened, often nearly horizontal, elongate, fleshy-suffrutescent. **STEMS** up to 10 cm long, usually much less, herbaceous-succulent, spreading, procumbent to ascending, sometimes branching basally. **LEAVES** sessile, subterete, obtuse, up to 1.5 (2) cm long, usually light glaucous, sometimes dark green or purplish. **INFL** 1-flowered (rarely cymulose and few-flowered), not or barely exceeding leaves; peduncle short, not scapelike, up to 5 mm long. **FLOWERS** variably polygamomonoecious (occurence inconsistent even within one plant, and apparently affected by growth conditions); sepals scarious and early-deciduous, oval to orbiculate, up to 5 mm long, apically rounded to obtuse, not exceeding capsule; petals white to magenta, usually pink to lavender, obovate, rounded to obtuse, up to 12 mm long; stamens 10–25, color mostly matching or lighter than petals; pistil greatly exceeding stamens, with 3 stigma lobes, sublinear. **FRUIT** a capsule, subglobose to ellipsoid, apically rounded to obtuse, 3.5–5 mm long. **SEEDS** without arcuate ridges, 1–1.4 mm long. Most often in small local populations in slickrock country; primarily shallow, fine sand pockets overlying noncalcareous, often reddish sandstones; mostly within piñon-juniper woodland communities. ARIZ: Apa, Coc, Nav; NMEX: McK, SJn; UTAH. 1555–2130 m (5100–6990′). Flowering: Apr–Sep. Arizona to Texas.

Phemeranthus confertiflorus (Greene) Hershkovitz (densely flowered) Rocky Mountain fameflower, Rocky Mountain rockpink, Rocky Mountain sunbright, New Mexico fameflower. Herbaceous, succulent perennial; rootstock thick, fleshy-suffrutescent, vertical, irregularly and few-branched. **STEMS** 2–10 (15) cm, ± erect, simple or branching, base often perennial, suffrutescent, shiny orange-brown to dark reddish or brown, remainder of stem annual, succulent-herbaceous, green to slightly purplish, usually glaucous. **LEAVES** succulent, sessile, terete, sometimes slightly broadened at base, up to 2.5 (4) cm long; mostly glaucous gray-green, often purplish apically, especially under stress; dried bases often persistent on stems. **INFL** cymose, exceeding leaves; peduncle scapelike, to 10 (15) cm long. **FLOWERS** subsessile to short-pedicellate; sepals foliaceous becoming scarious, persistent, ovate, up to 4 mm long, apex often purplish, acuminate to acute; corolla white to light pink, rarely purplish, elliptic to obovate, acuminate to acute, petals up to 6 mm long; stamens 5 (–10), color mostly matching or lighter than petals; pistil not or little exceeding stamens; stigma subcapitate, 3-lobed. **FRUIT** a capsule, broadly ellipsoid, obtusely trigonous, usually broadly acute apically, 3–6 mm long. **SEEDS** nearly smooth, black, but pellicle imparting gray or blue-gray color, 0.8–1.2 mm long. $2n = 48$.

[*Talinum confertiflorum* Greene; *T. gracile* Rose & Standl.; *T. rosei* P. Wilson; *T. gooddingii* P. Wilson; *T. fallax* Poelln.]. Sandy, gravelly, rocky, or shallow soil pockets overlying rock; black sagebrush, piñon-juniper, and ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: Arc, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1450–2685 m (4755–8185'). Flowering: Apr–Oct. Arizona and Idaho to North Dakota, south to Texas; northern Mexico. Persistently confused with *P. parviflorus* (Nutt.) Kiger, but that species distinguished by obtuse, early-deciduous sepals; capsules usually more broadly rounded, obtuse; seeds deep brown to black, even with pellicle intact; more easterly distribution; $2n = 24$. Used by the Ramah Navajo as a poultice of root bark, applied to sores and used as a lotion.

Portulaca L. Purslane, Mossrose

(Latin *portula*, little door, in reference to the lid of the capsule) Annual or perennial succulent herbs; root fleshy-fibrous to tuberous, mostly with a single, often tuberous taproot and laterals. **STEMS** prostrate to erect, usually branched, sometimes suffrutescent; hairlike trichomes in inflorescence or stem, nodes absent or present, otherwise glabrous. **LEAVES** succulent, alternate or subopposite, congested and involucre-like immediately proximal to inflorescence; blade terete, subterete, or flattened. **INFL** terminal or axillary on short branches, reduced, subtended by several densely crowded leaves, multiflowered and tightly crowded. **FLOWERS** sessile or subsessile, diurnal but open only a short time each day; sepals broadly clasping at base, herbaceous to scarious; petals 5–7, usually distinct, margins usually entire; stamens 4–many; ovary 1/2 inferior to inferior, plurilocular proximally to 1-locular distally, placentation free-central; style 1, stigma lobes 3–18. **FRUIT** a capsule, circumscissally dehiscent before dry, remaining base persistent or deciduous after drying. **SEEDS** many, dark brown to black, reniform to orbicular or globose, smooth to tuberculate; with tightly investing pellicle apparently of epidermal origin, often giving metallic blue or gray appearance; testa with raised, rounded-stellate pattern cells. Species about 100 nearly worldwide, primarily tropical and subtropical; also temperate.

1. Leaves flat, spatulate; axils not or inconspicuously pilose ..... ***P. oleracea***
1' Leaves linear, terete or nearly so; axils pilose ..... (2)

2. Flowers usually over 5 mm wide, usually magenta; taproot thickened-tuberous or napiform ..... ***P. mundula***
2' Flowers usually less than 5 mm wide, yellow to yellow-orange; roots not thickened ..... ***P. halimoides***

Portulaca halimoides L. (having the form of or a resemblance to the genus *Halimium*) Sand mossrose, dwarf purslane, silkcotton purslane. Succulent annual; root fibrous, usually 1 taproot with laterals. **STEMS** prostrate to suberect, usually many-branched, often reddish in stress, 1–15 (–25) cm long, leaf axils and inflorescence moderately villous, this more conspicuous as the plant ages. **LEAVES** glabrous, linear, terete to broadly subulate, 2–15 × 0.4–1.5 mm, apex obtuse to acute; involucre-like leaves 4–10. **FLOWERS** 1–8 mm diameter; corolla yellow to orange, rarely red, obovate, 1–4 × 1–2.5 mm; stamens 5–20; stigma lobes 3–6. **FRUIT** a capsule, ovoid, usually short-stipitate, 1–3 mm diameter. **SEEDS** gray to nearly black, 0.3–0.6 mm wide, stellate-tubercular. $2n = 18$. [*P. parvula* A. Gray]. Sandy soil in mostly open saltbush, ephedra, cliffrose, and piñon-juniper communities. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1370–1895 m (4500–8000'). Flowering: May–Sep, depending upon temperature and precipitation. California, Arizona to Oklahoma and Texas, Arkansas, east to Virginia and Delaware; Mexico; West Indies; Central America; South America. Used as a potherb before introduction of *P. oleracea* L.

Portulaca mundula I. M. Johnst. (trim or neat) Rock mossrose, purple mossrose, kiss-me-quick. Succulent annual to short-lived perennial; root a taproot, tuberous, ovoid to napiform, usually unbranched. **STEMS** suberect to erect, ascending in age, usually few-branched, often reddish in stress; leaf axils and inflorescence conspicuously white-villous; branches 2–10 (15) cm. **LEAVES** often glaucous, linear, terete to broadly subulate, 5–15 (20) × 1–2 mm, apex obtuse to acute; involucre-like leaves 4–10. **FLOWERS** 4–15 mm diameter; corolla pink, magenta, purple, or rarely white, obovate, 2–8 × 1.5–3.5 mm; stamens 5–15 (30); stigma lobes 3–6. **FRUIT** a capsule, ovoid, usually short-stipitate, 1.5–6 mm diameter. **SEEDS** usually gray to metallic, due to slightly separated investing pellicle, blackish if rubbed, 0.5–1.2 mm long. $2n = 8, 16$. [*P. pilosa* L. var. *mundula* (I. M. Johnst.) D. Legrand]. Shallow soils over rock, or exposed gravelly to rocky substrates, mostly ledges, slopes, hilltops. COLO: Mon (Mesa Verde National Park); NMEX: SJn. 2135 m (7000'). Flowering: May–Oct, depending upon temperature and precipitation. Southern Colorado, southern Kansas west to eastern Arizona, east to Missouri, North Carolina, south to Florida; northern Mexico.

Portulaca oleracea L. (herbaceous) Common purslane, pursley, little hogweed. Glabrous; annual (ours); root fibrous, usually from slender main taproot; with globular to ovoid, tuberous taproot. **STEMS** prostrate to ascending, succulent; trichomes in axils and inflorescence absent or inconspicuous; branches up to 60 cm wide. **LEAVES** 1–6, obovate

or spatulate, usually truncate to rounded, occasionally retuse, flattened, 4–30 × 2–15 mm, apex round to retuse or nearly truncate; involucre-like. **FLOWERS** 3–10 mm diameter; petals yellow to purple (yellow to orange in ours), oblong, 3–4.6 × 1.8–3 mm; stamens 3–20; stigma lobes 3–6. **FRUIT** a capsule, ovoid to globose or rounded-turbinate, 4–9 mm long. **SEEDS** orbiculate, somewhat flattened, 0.4–1.5 mm long, gray to black, minutely punctate. $2n = 18$, 36, 54. Open, sunny areas, a weed of cultivated areas, roadsides, and indigenous plant communities. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, Hin, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1125–2440 m (3700–8000'). Flowering: late spring–early fall, depending primarily upon availability of moisture. Widely distributed in North America; cosmopolitan. Plant used for pain by the Navajo. The Ramah Navajo used the leaves as a potherb. The Kayenta Navajo used the plant as a lotion for scarlet fever.

POTAMOGETONACEAE Bercht. & J. Presl PONDWEED FAMILY

C. Barre Hellquist

Perennial or annual herbs; rhizomatous or nonrhizomatous; caulescent; turions absent or present. **LEAVES** stipulate, simple, alternate, submersed, or submersed and floating, sessile or petiolate. **INFL** a spike, capitate spike, or panicle of spikes borne axillary or terminal, submersed or emersed. **FLOWERS** with 4 tepals in 1 series, stamens (2–) 4, epipetalous in 1 series; anthers dehiscing vertically; pistils 1–4, mostly not stipitate, ovules marginal. **FRUIT** a drupe. **SEEDS** 1 with curved embryo. $x = 13$, 14 (Fernald 1932; Hagström 1916). Three genera and about 100 species worldwide.

1. Submersed leaves lacking adnate stipular sheaths; peduncles stiff, inflorescences submersed or erect if on the surface ..... ***Potamogeton***
1' Submersed leaves with stipular sheaths adnate for 2/3 or more their length; peduncles flexible, inflorescences floating on the surface ..... ***Stuckenia***

Potamogeton L. Pondweed

(Greek *potamos*, river neighbor) Perennial or annual herbs, rhizomes present or absent, no tubers formed, turions formed on some species. **STEMS** terete to compressed, nodes with oil glands present or absent. **LEAVES** submersed or submersed and floating, alternate, some nearly opposite, stipule connate or convolute, tubular, sheathing the stem; submersed leaves sessile, petiolate, or perfoliate, apex subulate to obtuse, 1–35 veins; margins entire or serrate, stipules either free or adnate to the leaf base for less than 1/2 the length of the stipule; floating leaves petiolate, rarely sessile, stipule free from leaf base; blades elliptic to ovate, leathery, base cuneate, rounded to cordate, 1–51 veins. **INFL** a spike or panicle of spikes, submersed and/or emersed, capitate, or cylindric; peduncles stiff, often projecting above the water surface. **FLOWERS** with pistils 1 or 4. **FRUIT** abaxially rounded or keeled, beaked, embryo coiled 1 or more times. $x = 13$, 14 (Haynes 1975; Ogden 1943). About 90 species worldwide. *Potamogeton* plants are extremely important food sources for waterfowl and habitat for numerous aquatic animals. Whenever possible, plants collected should be in fruit. These are important for species identification.

1. Plants producing floating leaves ..... (2)
1' Plants lacking floating leaves ..... (5)

2. Submersed leaves linear, 0.8–2 mm wide, petiole of floating leaves pale at junction with blade ..... ***P. natans*** (in part)
2' Submersed leaves broadly linear-oblong, lanceolate to elliptic, petiole of floating leaves not pale at junction with blade ..... (3)

3. Submersed leaves petiolate; fruits 3.5–4.3 mm long ..... ***P. nodosus*** (in part)
3' Submersed leaves sessile; fruits 1.7–3.5 mm long ..... (4)

4. Submersed leaves with distinct reticulate portion along midrib, leaf tips obtuse or somewhat acute, fruit stalked ..... ***P. alpinus*** (in part)
4' Submersed leaves lacking reticulate portion along midrib, leaf tips sharply acute or awl-shaped ..... ***P. gramineus*** (in part)

5. Leaf margins distinctly serrate, fruit beaks 2–3 mm long ..... ***P. crispus***
5' Leaf margins entire, fruit beaks lacking or less than 2 mm long ..... (6)

6. Submersed leaves linear, 2 mm or less wide ..... (7)
6' Submersed leaves broadly linear-oblong to lanceolate to elliptic, 10–75 mm wide; fruits 1.7–3.5 mm long ..... (9)

7. Submersed leaves phyllodial, 0.8–2 mm wide (young plants), lacking distinct veins ..... ***P. natans*** (in part)
7' Submersed leaves flattened, less than 2 mm wide, with 3–5 distinct veins ..... (8)

8. Nodal glands present at the base of leaves; peduncles terminal or terminal and axillary, straight ..... ***P. pusillus***
8' Nodal glands lacking at the base of leaves; peduncles axillary, recurved ..... ***P. foliosus***

9. Submersed leaves clasping the stem ..... (10)
9' Submersed leaves sessile (not clasping) or petiolate ..... (11)

10. Rhizomes spotted rusty red; stems with a zigzag appearance, the stem changing direction at each node; leaf tips boat-shaped, splitting when pressed ..... ***P. praelongus***
10' Rhizomes white, unspotted; stems straight, lacking the zigzag appearance; leaf tips flat, not splitting when pressed ..... ***P. richardsonii***

11. Submersed leaves petiolate; fruits 3.5–4.3 mm long ..... ***P. nodosus*** (in part)
11' Submersed leaves sessile; fruits 1.9–3.5 mm long ..... (12)

12. Leaf apex obtuse to somewhat acute, leaves with reticulate portion along midrib, fruit stalked ..... ***P. alpinus*** (in part)
12' Leaf apex sharply acute or awl-shaped, leaves lacking reticulate portion along midrib, fruit lacking a stalk ..... ***P. gramineus*** (in part)

Potamogeton alpinus Balb. (alpine) Alpine pondweed. Perennial from rhizomes. **STEMS** terete. **LEAVES** submersed and floating or only submersed; submersed leaves sessile, blades reddish green, oblong-linear to linear-lanceolate, 4.5–18 (–25) × 0.5–2 cm, base rounded, apex obtuse to acute, lacunae 0–6 rows on each side of the midvein, often transitioning into floating leaves, stipules persistent, convolute, apex blunt, 1.2–4 cm; veins 7 (–9); floating leaves reddish green, elliptic, oblanceolate, obovate to oblong-linear, 4–7 (–10) × 1–2.5 (–4) cm, base gradually tapering into petiole; apex obtuse or acute, veins (7–) 9–13 (–15). **INFL** unbranched, emersed, peduncles terminal or axillary, erect, 3–10 (–16) cm, spikes cylindric, 10–35 mm. **FRUIT** olive-green, with or without keels, 2.5–3.5 × 1.7–2.4 mm, beak curved, 0.5–0.9 mm. $2n = 52$. [*P. alpinus* subsp. *tenuifolius* (Raf.) Hultén; *P. alpinus* var. *subellipticus* (Fernald) Ogden; *P. alpinus* var. *tenuifolius* (Raf.) Ogden; *P. tenuifolius* Raf.; *P. tenuifolius* var. *subellipticus* Fernald]. Cold, neutral to alkaline streams, lakes, and ponds, often at inlets. ARIZ: Apa; COLO: Con, Hin, Mon, RGr, SJn. 2330–3425 m (7700–11300'). Flowering: Jun–Aug. Fruit: Jul–Aug. Alaska and Nunavut east to Newfoundland, south in the mountains of California and Colorado, Minnesota, Michigan, and Maine; Eurasia. It is known to hybridize with *P. gramineus*, *P. nodosus*, and *P. praelongus* from our area.

Potamogeton crispus L. (crimped) Curly-leaved pondweed, curled pondweed. Turions common, axillary and terminal, hard. Rhizomes absent. **STEMS** flattened. **LEAVES** submersed, linear, 4–10 mm wide, base obtuse to rounded, margins serrate, apex round to round-acute, lacunae in 2–5 rows on each side of midvein. **INFL** emersed; peduncles terminal, rarely axillary, erect to ascending, cylindric, 2.5–4 cm; spikes cylindric, 10–15 mm. **FRUIT** red to reddish brown, keeled, beak 2–3 mm. $2n = 52$. Alkaline or polluted waters of streams, lakes, and ponds. NMEX: McK, SJn. 1550–1900 m (5115–6300'). Flowering: Jun–Jul. Fruit: July. British Columbia east to Saskatchewan, Ontario, and Quebec, south to California, Arizona, Texas, Louisiana, and Florida; South America; Eurasia; Australia. This is the only pondweed introduced into North America. It was introduced in the mid-1880s in the eastern United States. This species reaches sexual maturity early in the season, usually May and June, but observed later in the Southwest. It occasionally produces fruit and regularly produces hard, almost woody, turions. The plant deteriorates in about a month and the turions are released. These root during the summer and the plants remain small until spring, when they grow rapidly.

Potamogeton foliosus Raf. (leafy) Leafy pondweed. Turions uncommon, lateral and terminal, soft, inner leaves rolled into a hardened, fusiform structure; rhizomes absent or present (in shallow streams). **STEMS** slightly compressed, glands usually absent, if present 0.3 mm. **LEAVES** submersed, linear, 0.3–2.3 mm wide (wider in flowing streams), base slightly tapering, apex usually acute, rarely apiculate, lacunae 0–2, usually none, on each side of the midvein, veins 1–3 (–5); stipules disintegrating with age, convolute, delicate to fibrous, apex obtuse, 0.2–2.2 cm. **INFL** unbranched, emersed; peduncles in leaf axils, recurved, clavate, 0.3–1.1 (–3.7) cm, spikes capitate to cylindric, 1.5–7 mm. **FRUIT** olive-green or brown, obovate to orbicular, concave, 1.5–2.7 × 1.2–2.2 mm, keel 0.2 mm high, undulate, beak 0.2–0.6 mm. $2n = 28$. [*P. curtissii* Morong; *P. foliosus* var. *macellus* Fernald]. Neutral to alkaline streams, ponds, and lakes. ARIZ:

Apa; COLO: LPl; NMEX: McK, SJn. 1400–2750 m (4620–9075'). Flowering: Jun–Aug. Fruit: Jul–Aug. Alaska east to Nova Scotia, south to California, Texas, and Florida; Central America. Two subspecies occur in the United States; ours is **subsp.** ***foliosus***. Plants are often more robust in faster-flowing waters.

Potamogeton gramineus L. (grasslike) Variable pondweed. Perennial from rhizomes. **STEMS** terete. **LEAVES** submersed and floating, or only submersed, sessile, blade elliptic, apex acuminate, lacunae in 1–2 rows on either side of the midvein, 3–9 veins; apex acute to obtuse; floating leaves with petioles 3–4.5 cm long, blades elliptic to ovate, 3.5–4 × 1.6–2 cm, base rounded, apex acuminate, veins 11–13; stipules persistent, convolute, 1.3–1.6 cm. **INFL** unbranched, emersed; peduncles both axillary and terminal, erect to ascending, cylindric, 3.2–7.7 cm, spikes cylindric, 1.5–3.5 cm. **FRUIT** greenish brown, ovoid, laterally compressed, keeled, 1.9–2.3 × 1.8–2 mm, beak 0.3–0.5 mm. $2n = 52$. [*P. gramineus* var. *maximus* Morong; *P. gramineus* var. *myriophyllus* J. W. Robbins]. Acid to alkaline waters in streams, lakes, ponds, and bogs. ARIZ: Apa; COLO: Arc, Hin, LPl, Mon, SJn; NMEX: McK, SJn. 2325–2850 m (7675–9400'). Flowering and fruiting: Jul–Aug. Alaska east to Newfoundland, south to California, Colorado, Kentucky, and Pennsylvania; Eurasia. *Potamogeton gramineus* is a highly variable species that takes on many different forms. The narrowest forms occur in acid waters, particularly bogs. The broader-leaved plants often approach *P. illinoensis* Morong in stature. From the Four Corners region it has been documented hybridizing with *P. alpinus*, *P. natans*, *P. nodosus*, *P. praelongus*, and *P. richardsonii*.

Potamogeton natans L. (swimming) Floating-leaf pondweed, floating brownleaf. Perennial from rhizomes. **STEMS** terete. **LEAVES** submersed and floating, submersed leaves sessile, phyllodial, 0.7–2.2 mm wide, apex obtuse, 3–5 veins; stipules persistent, convolute, free from blade 4.5–10 cm; floating leaves with petiole a lighter color at the junction with the leaf blades, blades elliptic to ovate, 3.5–11 cm, veins 17–37. **INFL** unbranched, emersed, peduncles terminal, cylindric, 25–50 mm. **FRUIT** sessile, green to greenish brown, obovoid, unkeeled, 3.5–5 × 2–3 mm, beak 0.4–0.8 mm. $2n = 52$. Acid to alkaline waters of lakes, ponds, and slow-flowing streams. ARIZ: Apa; COLO: LPl, RGr, SJn; NMEX: SJn. 2200–2875 m (7290–9450'). Flowering: Jul–Aug. Alaska, Yukon, and Manitoba, east to Newfoundland, south to California, New Mexico, Indiana, and West Virginia; Eurasia. The Navajo have used this species as a ceremonial emetic.

Potamogeton nodosus Poir. (knotty) Long-leaf pondweed. Perennial from rhizomes. **STEMS** terete. **LEAVES** submersed and floating, or only submersed, submersed leaves with petioles 2–13 cm, blade linear-lanceolate to lance-elliptic, 9–20 × 1–3.5 cm, base and apex acute, 2–5 rows of lacunae on each side of midvein, stipules mostly persistent, convolute, free from blade, 3–9 cm; floating leaf petioles 3.5–26 cm, blades lenticular to elliptic, 3–11 × 1.5–4.5 cm, bases mostly rounded, apex acute to rounded, veins 9–21. **INFL** unbranched, emersed, peduncles terminal, erect to ascending, cylindric, 3–15 cm, spikes cylindric, 20–70 mm. **FRUIT** red to reddish brown, keeled, laterally ridged, 2.7–4.3 × 2.5–3 mm, beak erect. $2n = 52$. [*P. americanus* Cham. & Schltdl.]. Fast-flowing streams of low alkalinity or ponds, lakes, and slow-flowing streams. COLO: Arc, LPl, SJn; NMEX: SJn; UTAH. 1625–2080 m (5350–6875'). Flowering and fruiting: Jul–Aug. British Columbia east to New Brunswick, south to California, Texas, and Florida; Mexico; West Indies; Central America; South America; Eurasia. This is one of the most common species in North America and the world. It has been documented in North America hybridizing with *P. alpinus*, *P. gramineus*, *P. illinoensis*, *P. natans*, and *P. richardsonii*.

Potamogeton praelongus Wulfen (greatly prolonged) White-stemmed pondweed, muskie-weed. Rhizomes present. **STEMS** white, terete. **LEAVES** submersed, linear-lanceolate, base clasping, apex hooded or boat-shaped, obtuse, splitting when pressed, lacunae absent, 1.1–4.6 cm wide; stipules persistent, conspicuous, convolute, 3–8.1 cm, fibrous, shredding at apex. **INFL** emersed, unbranched, terminal or axillary, erect, cylindric, 9.5–53 cm, spikes cylindric, 3.4–7.5 cm. **FRUIT** greenish brown, obovoid, keeled, 4–5.7 × 3.2–4 mm, beak 0.5–1 mm. $2n = 52$. Usually in deep, neutral to moderately alkaline waters of ponds and lakes. COLO: SJn. 3275 m (10744'). Flowering: Jun–Jul. Fruit: Jul–Aug. Alaska east to Newfoundland, south to California, Colorado, Nebraska, Indiana, and New Jersey. This species flowers and fruits early in the season. It often grows in deep water. It is easily distinguished by the zigzag pattern of the stem reversing direction at each node and the large, persistent stipules. Hybrids have been documented in North America with *P. alpinus*, *P. crispus*, *and P. gramineus*.

Potamogeton pusillus L. (very small) Rhizomes absent or present. Turions common, lateral and terminal, soft, 2-ranked, inner leaves rolled into hard fusiform structure. **STEMS** terete to slightly compressed, nodal glands present on most nodes, 0.05 mm diameter. **LEAVES** submersed, sessile, blade linear, 0.5–1.9 mm wide, base slightly tapered, lacunae 0–2 on each side of the midvein, veins (1–) 3, apex acute, rarely apiculate, stipules persistent, connate, apex obtuse, 3–9 mm. **INFL** unbranched; peduncles 1–3 per plant, filiform to cylindric, erect to slightly clavate; spikes

capitate to cylindric, interrupted, 1.5–10.1 cm. **FRUIT** obovoid, sides centrally concave, 1.5–2.2 × 1.2–1.6 mm, beak 0.1–0.6 mm. $2n = 26$. [*P. panormitanus* Biv.; *P. pusillus* var. *minor* (Biv.) Fernald & B. G. Schub.] Neutral to alkaline waters of lakes, ponds, and streams. ARIZ: Apa; COLO: Dol, SJn; NMEX: McK, SJn; UTAH. 1600–2725 m (5280–9000'). Flowering and fruiting: Jul–Sep. Yukon east to Nova Scotia, south to California, New Mexico, Texas, and Florida. South America; Eurasia; Africa. Three subspecies occur in the United States, of which only **subsp. *pusillus*** occurs in our area.

Potamogeton richardsonii (A. Benn.) Rydb. (for Sir John Richardson, 1787–1865) Clasping-leaved pondweed, bass-weed, Richardson's pondweed. Rhizomes present. **STEMS** terete. **LEAVES** submersed, clasping, ovate-lanceolate to narrowly lanceolate, margins crisped; apex acute to obtuse, lacunae absent, 0.5–2.8 cm wide, veins 3–35, stipules persistent, conspicuous, convolute, disintegrating to persistent fibers, obtuse until splitting. **INFL** emersed, unbranched, peduncles terminal or axillary, erect to recurved, clavate, 1.5–14.8 cm, spikes cylindric, 13–47 mm. **FRUIT** greenish brown, obovoid, turgid to concave, keeled, 2.2–4.2 × 1.7–2.9 mm; beak 0.4–0.7 mm. $2n = 52$. [*P. perfoliatus* L. var. *richardsonii* A. Benn., *P. perfoliatus* subsp. *richardsonii* (A. Benn.) Hultén]. Alkaline waters of lakes, ponds, and rivers. ARIZ: Apa; COLO: Arc, 2080–2750 m (6850–9050'). Flowering and fruiting: Jul–Aug. Alaska east to Newfoundland, south to California, Colorado, Michigan, Pennsylvania, and Connecticut. Two hybrids have been documented in North America, hybridizing with *P. gramineus* and *P. nodosus*.

Stuckenia Börner Pondweed

(derivation unknown) Perennial herbs from rhizomes, often with tubers. **LEAVES** submersed, alternate, channeled, turgid, margins entire, apex acute, obtuse, veins 1–5; stipules adnate to leaf base for 2/3 or more of the length of the stipule, terminating in a free ligule. **INFL** a capitate or cylindric spike, submersed, peduncles flexible, floating on the water surface. **FLOWER** pistils 4. **FRUIT** abaxially rounded, beaked or lacking beak, embryo with less than 1 full coil. $x = 13$ (Börner 1912; Holub 1997; St. John 1916). About six species worldwide.

1. Leaf apex acute, apiculate, cuspidate, or rarely rounded; fruit with distinct beak ..... (2)
1' Leaf apex retuse, blunt, or apiculate; fruit with minute beak or beakless ..... (3)

2. Leaves 0.2–1 mm wide; leaf apex acute (rarely apiculate in young plants) ..... ***S. pectinata***
2' Leaves 0.8–1.7 mm wide; leaf apex apiculate, cuspidate, or rounded ..... ***S. striata***

3. Free portion of stipule forming a distinct ligule up to 20 mm long; tips of midstem stipular sheaths distinctly inflated, fruits 3–3.5 mm long ..... ***S. vaginata***
3' Free portion of stipule forming a small ligule up to 1 mm long; tips of midstem stipular sheath slightly inflated; fruits 2–3 mm long ..... ***S. filiformis***

Stuckenia filiformis (Pers.) Börner (threadlike) Threadleaf pondweed. **STEMS** branching, subterete. **LEAVES** on main stem slightly larger than those on branches, lower stipular sheaths often inflated, 1–4.5 (–9.5) cm, blade filiform to linear, 0.2–2 (–3.7) mm, apex notched, blunt, or short-apiculate, veins 1–3. **INFL** peduncles terminal, erect, filiform to slender, 2–10 (–15) cm; spikes cylindric to moniliform, 5–55 mm, 2–6 (–9) whorls, often adjacent. **FRUIT** dark brown, 2–3 × 1.5–2.4 mm, beak obscure. $2n = 78$. [*Potamogeton filiformis* Pers.]. Calcareous, alkaline waters of rivers, streams, and shallow waters of shorelines of lakes and ponds. COLO: Arc, LPl, SJn; NMEX: SJn; UTAH. 1970–3700 m (6500–12180'). Flowering: Jun–Aug. Fruit: Jul–Aug. Alaska, Northwest Territories, and Nunavut east to Quebec and Newfoundland, south to California, New Mexico, Nebraska, Michigan, New York, and Pennsylvania; Eurasia. Subspecies five, three in North America, one (possibly two) in our range. Most of our material is **subsp. *alpina*** (Blytt) R. R. Haynes. Les & M. Král (alpine), which are short plants, typically with narrow leaves. Some material in our area is larger and more taxonomic study is needed on this taxon.

Stuckenia pectinata (L.) Börner (comblike) Sago pondweed. **STEMS** branched, usually distally, terete to slightly compressed. **LEAVES** of main stem only slightly larger than those of the branches; stipular sheaths not inflated, 0.8–1.1 cm long, ligule to 0.8 mm, blade linear, 0.2–1.1 mm wide, apex acute, mucronate or blunt on young stems, veins 1–3. **INFL** peduncles terminal or axillary, cylindric, 4.5–11.4 cm; spikes moniliform to cylindric, 14–22 mm, 3–5 whorls. **FRUIT** yellow-brown to brown, 3.8–4.5 × 2.5–3.1 mm, beak erect, 0.5–1.1 mm. $2n = 78$. [*Coleogeton pectinatus* (L.) Les & R. R. Haynes; *Potamogeton interruptus* Kit.; *P. pectinatus* L.]. Calcareous, saline, and alkaline waters of ponds, lakes, springs, streams, and rivers. ARIZ: Apa; COLO: Hin, LPl, Mon, SJn, SMg; NMEX: SJn; UTAH. 1600–2750 m (5365–7075'). Flowering: Jul–Aug. Alaska east to Newfoundland, south throughout the United States; Mexico; almost worldwide. The tubers produced are a valuable waterfowl food.

Stuckenia striata (Ruiz & Pav.) Holub (furrowed, channeled) Nevada pondweed. **STEMS** branched distally, 5-ridged to terete. **LEAVES** on stems 2 times or more those on branches, stipular sheaths not inflated, 1.2–3.4 cm long, ligule 0.2–1.1 cm; blade linear, 0.4–5.1 (–8.5) mm wide (0.8–1.7 mm on plants in our range); apex apiculate, cuspidate, rarely rounded, veins 3–5. **INFL** peduncles axillary, rarely terminal, erect to ascending, cylindric, 1.2–5.2 cm; spikes cylindric, occasionally moniliform, 13–45 mm; 4–9 whorls. **FRUIT** brown to reddish brown, 3–3.9 × 2.8–3 mm, beak erect, rarely curved, 0.2–0.3 mm. [*Potamogeton striatus* Ruiz & Pav.; *P. latifolius* (J. W. Robbins) Morong]. Calcareous and alkaline waters of rivers, canals, irrigation ditches, and ponds. NMEX: SJn. 1600 m (5275′). Flowering and fruiting unknown in our range. Oregon east to Colorado, south to California, Texas; Central America; South America. This species is uncommon throughout its range in the western United States. This was previously known as *Potamogeton latifolius* but was found to be the same taxon as *S. striata.*

Stuckenia vaginata (Turcz.) Holub. (sheathed) Bigsheath pondweed. **STEMS** readily branched, terete. **LEAVES** on stem only slightly larger than those on branches, stipulular sheaths inflated 3–5 times the stem thickness, 2–9 cm long, ligule absent or to 0.2 mm. Blade filiform to linear, 0.2–2.9 mm wide, apex rounded, obtuse, or slightly notched, veins 1(–3). **INFL** peduncles terminal, erect, 3–15; spikes moniliform, 10–80 mm, 3–12 whorls. **FRUIT** brown, 3–3.8 × 2–2.9 mm, beak small. $2n = 78$. [*Potamogeton vaginatus* Turcz.]. Calcareous, alkaline waters of lakes and ponds. NMEX: SJn. 2740 m (9042′). Flowering: Jul–Aug. Fruit: Jul–Aug. Alaska and Northwest Territories east to Nunavut, and Ontario south to California, New Mexico, Colorado, and Minnesota; Eurasia. One record for this taxon is known in our range from the Chuska Mountains. This is the southernmost record for this species in North America.

PRIMULACEAE Batsch ex Borkh. PRIMROSE FAMILY

Sylvia Kelso

Herbs, perennial or annual. **LEAVES** alternate, opposite, or whorled, often basal, entire to lobed. **INFL** a panicle, raceme, umbel, or with flowers solitary, usually subtended by bracts. **FLOWERS** perfect; sometimes heterostylous (only in *Primula* in our region); sepals usually 5, more or less united; corolla regular; petals 5, united or rarely lacking (*Glaux*); stamens 5, opposite the corolla lobes; pistil 1, ovary superior to partly inferior, 1-loculed, 5-carpelled; style 1; stigma capitate. **FRUIT** a capsule. In its traditional sense, the primrose family contains about 22 genera and over 1000 species worldwide, mostly occurring in temperate and mountainous regions of the Northern Hemisphere. The center of diversity for the family lies in Asia, notably in western China and the Himalayas. Recent molecular analyses have suggested that some genera traditionally placed in the Primulaceae may be more closely related to the primarily tropical families Myrsinaceae and Theophrastaceae. In this view, *Glaux* and *Lysimachia* would be transferred to a more inclusive Myrsinaceae. Other molecular data show a close relationship between *Dodecatheon* and *Primula*; based on this evidence and the floral similarity of the two genera, some botanists suggest that *Dodecatheon* might be placed into a broadly defined genus *Primula*. The nomenclature provided here is the traditional circumscription of the Primulaceae to parallel the most generally accepted treatment for North American floras. Many species of *Androsace* and *Primula* are cultivated in gardens or as potted plants (Källersjö, Bergqvist, and Anderberg 2000; Mast et al. 2004).

1. Plants with leafy stems, diminutive, usually less than 10 cm tall ..... ***Glaux***
1′ Plants with basal leaves only, or if with leafy stems, then taller than 10 cm ..... (2)

2. Flowers axillary, yellow, on slender pedicels ..... ***Lysimachia***
2′ Flowers not as above ..... (3)

3. Corolla lobes reflexed ..... ***Dodecatheon***
3′ Corolla lobes erect or spreading ..... (4)

4. Flowers white; the corolla tube shorter than or barely equal to the calyx ..... ***Androsace***
4′ Flowers shades of pink, rose, purple, rarely white except in mutants; the corolla tube equal to or noticeably longer than the calyx ..... ***Primula***

Androsace L. Rock Jasmine

(Greek *androsac*, man, male, or husband, the reference obscure) **LEAVES** in a basal rosette, single or forming mats or compact cushions, vegetative parts completely efarinose (lacking a mealy powder on the surface). **INFL** an umbel subtended by 1–several bracts, with several to many flowers per umbel. **FLOWERS** pedicellate, calyces campanulate to subglobose, shallowly to deeply lobed; corollas white (in North American species), often fading to pinkish, eye yellow,

tube shorter than or barely equal to the calyx, limb 5-lobed, lobes entire to emarginate; homostylous. **FRUIT** subglobose, shorter than the calyx. **SEEDS** few to numerous, somewhat quadrate, usually less than 1 × 1 mm. $x = 10$. About 100 species, widely distributed across the temperate zone of the Northern Hemisphere

1. Plants perennial, with multiple rosettes, mat-forming ..... ***A. chamaejasme***
1′ Plants annual or biennial, with a single rosette, not mat-forming ..... (2)

2. Involucral bracts broad and leaflike ..... ***A. occidentalis***
2′ Involucral bracts narrow, lanceolate to subulate ..... ***A. septentrionalis***

Androsace chamaejasme Wulfen ex Host (creeping or mat-forming) Boreal rock jasmine. **LEAVES** in multiple rosettes forming a loose or dense mat, margins with prominent ciliate hairs, blade ligulate to oblong, 0.3–1.5 cm long, lacking petioles. **INFL** scape 2–7 (10) cm long, bracts broadly leaflike and often overlapping. **FLOWERS** 3–6 per umbel, pedicel less than 1 cm; calyx green, broadly campanulate to subglobose, about 3 mm; corolla limb 6–9 mm. **FRUIT** subglobose. $2n = 20$. Alpine tundra, in open gravelly areas. COLO: SJn; UTAH. 3000–3500 m (9850–10500′). Flowering: Jun–Jul. Fruit: Jul–Aug. Western North America, Eurasia. The distribution of this species in the region is unclear. It is extremely common throughout northern and central Colorado and documented throughout the high elevations of the mountain front of the southern Rockies into Taos County, New Mexico, on the border of Rio Arriba County. Similarly, it occurs in Utah in the La Sal Mountains on the northwestern edge of the Four Corners region. It is very likely that *A. chamaejasme* occurs in the higher peaks of the San Juan Mountains, where abundant appropriate habitat exists, but no specimens have yet been collected to verify its occurrence in the Four Corners region of Colorado. The Rocky Mountain representatives of this species have previously been classified as subsp. *carinata* (Torr.) Hultén on the basis of a single character: an apparently prominent keel on the leaf blade. Although this character does appear often on plants growing in exposed sites on the tundra, it disappears when these plants are grown in protected sites and transplant gardens. Material collected at the type locality on Pikes Peak in Colorado shows a carinate leaf at high elevation, but in the same material transplanted to lower elevations, the character disappears as the leaves flatten and expand in less environmentally stressful habitats, becoming identical to those described as subsp. *lehmanniana* from northwestern North America and Asia. Since this character is environmentally induced and there are no other reliable characters to distinguish these putative infraspecific taxa, all of our North American material should be treated as **subsp *lehmanniana*** (Spreng.) Hultén.

Androsace occidentalis Pursh (western) Western rock jasmine. **LEAVES** in a single rosette, lacking petioles, sparsely pubescent, broadly lanceolate or oblanceolate, entire or somewhat toothed, 0.5–3 cm long. **INFL** scape 2–10 cm long, sometimes multiple, bracts lanceolate to elliptic or almost ovate, with 3–10 flowers per umbel; pedicels 0.3–3 cm, slender, erect. **FLOWER** calyx green, broadly campanulate, ridged, about 0.5 cm; corolla limb 3–5 mm. **FRUIT** globose. $2n = 20$. Open areas with sandy or gravelly soil, in grassland, shrub, and open forest communities. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Mon, SMg; NMEX: McK, RAr, SJn. 1525–2225 m (5000–7300′). Flowering: May–Jun. Fruit: Jul. Western North America. Used by the Ramah Navajo as a decoction for birth injury.

Androsace septentrionalis L. (northern) Northern rock jasmine, pygmy flower rock jasmine. **LEAVES** in a single rosette, lacking petioles, sparsely or densely pubescent, oblanceolate to spatulate, usually toothed, 0.5–6 cm long. **INFL** scape 0–20 cm long, sometimes multiple, bracts narrowly lanceolate to linear-lanceolate, with 5–over 20 flowers per umbel; pedicels 0.3–6 cm, slender, erect. **FLOWER** calyx green, narrowly campanulate, about 0.5 cm; corolla limb about 0.3 cm. **FRUIT** globose or subglobose. $2n = 20$. Open areas with sandy or gravelly soil in grassland, shrub, forest, and tundra communities. ARIZ: Apa, Nav; COLO: Arc, Con, Dol, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, SJn. 1980–3505 m (6500–11500′). Flowering: May–Sep. Fruit: Jun–Oct. Western North America and throughout the Northern Hemisphere. This is our most common species of *Androsace*, extremely variable in its morphology, depending on elevation, exposure, and amount of light. The variation, which has resulted in many infraspecific names being applied over the years, appears to be entirely plastic, depending on the age of individuals and environmental factors. High-elevation individuals may be only 1 cm in height, while lowland individuals can be well over 10 cm; shaded areas produce long pedicels, exposed areas produce very short ones. Location and degree of pubescence and glands also vary greatly between and within populations. The morphological plasticity coupled with frequent selfing produces abundant local variants, none of which appear to be coherent enough to justify taxonomic recognition. Accordingly, *A. septentrionalis* is best treated as a single, highly variable species. Used by the Ramah Navajo for the following: cold infusion for internal pain, "life medicine," taken before sweat bath for venereal disease, and as a lotion to give protection from witches.

Dodecatheon L. Shooting Star

(ancient Greek, "flower of the twelve gods," the classical pantheon of deities in Greek mythology) **LEAVES** usually in a single basal rosette, simple, broadly lanceolate to elliptic, glandular-pubescent or glabrous, efarinose. **INFL** an umbel subtended by 1–several bracts, with 2 to more than 15 flowers per umbel. **FLOWER** calyces broadly campanulate, more or less 5-angled, lobes 4–5, divided about 1/4 the length of the calyx, corolla magenta (rarely white, in mutants), campanulate, limb (4) 5-lobed, usually entire, prominently reflexed at anthesis, homostylous. **FRUIT** cylindric, or somewhat ovoid-elliptic in our species, equal to or longer than the calyx. **SEEDS** numerous, somewhat quadrate, ovate or oblong, usually about 1 × 1 mm. $x = 11$. About 14 species, mostly occurring in North America north of Mexico, with one species in the Russian Far East.

Dodecatheon pulchellum (Raf.) Merr. **CP** (beautiful, referring to the flower) Darkthroat shooting star. **LEAVES** thick, somewhat succulent, tapering to obscure petioles, oblanceolate, 3–20 cm. **INFL** scape 15–50 cm with 1–many flowers per umbel. **FLOWER** corolla tube yellow, 0.8–1.2 cm long, lobes 5, pink to purple, 1–2 cm long; stigma lobe not conspicuously enlarged, little wider than the style. **FRUIT** 0.8–1.8 cm long. $2n = 44$. [*Dodecatheon radicatum* Greene]. Moist montane meadows. COLO: Arc, Mon. 2042–3414 m (6700–11200'). Flowering: Jun–Jul. Fruit: Jul–Aug. Widely distributed across western North America; however, quite rare in the Four Corners region.

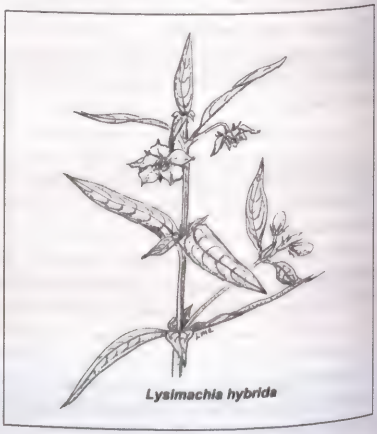
Glaux L. Sea Milkwort

(Greek *glaucus*, blue-green, for the color of the leaves and stem) **LEAVES** occurring throughout the stem, usually opposite below, becoming alternate above, simple, oval to narrowly oblong, efarinose. **INFL** with flowers solitary in the axils of the leaves. **FLOWER** calyces campanulate, with 4–5 petal-like lobes; corolla lacking. **FRUIT** globose. **SEEDS** few, somewhat flattened, about 1 × 1 mm. $x = 15$. A single species, widely distributed in the temperate zone of the Northern Hemisphere.

Glaux maritima L. (seaside, referring to the saline habitat) Sea milkwort. Plants diminutive, growing from shallow, slender rhizomes, vegetative parts efarinose. **LEAVES** appearing throughout the stem, sessile, 0.3–2 × 0.1–0.5 cm, elliptic to oblanceolate. **INFL** scape 3–25 cm, with flowers appearing in the leaf axils, sessile or subsessile. **FLOWER** calyx white or pinkish, campanulate, 3–4 mm, 4–5-lobed, petaloid, corolla lacking, homostylous. **FRUIT** globose, 2–3 mm long, more or less equal to the calyx. $2n = 30$. Moist, alkaline or saline soils, seeps, springs, stream banks, and meadows. Known from one location near Navajo Dam. NMEX: SJn. 1830 m (6000'). Flowering: Jun. Fruit: Jul–Sep. Widely distributed in North America and throughout the Northern Hemisphere.

Lysimachia L. Loosestrife

(from the name of the ancient Greek king Lysimachos, believed to have tamed a wild bull with this herb) **LEAVES** occurring throughout the stem, opposite, sessile to long-petiolate, ovate to ovate-lanceolate. **INFL** a terminal raceme or solitary and pedicellate in axils of the leaves. **FLOWER** calyces campanulate, deeply 5 (–9)-parted nearly to the base; corollas rotate, deeply 5 (rarely 3–9)-parted nearly to the base; homostylous. **FRUIT** globose to ovoid. **SEEDS** few to many, oblong to trigonous. About 180 species, mostly distributed in the temperate zone of the Northern Hemisphere, but a few species also occurring in Africa, South America, and Australia.



Lysimachia hybrida

Lysimachia hybrida Michx. (referring to an intermediate morphology between *L. ciliata* and *L. lanceolata*) Plants erect to somewhat reclining, stems simple or sparingly branched, to about 1 m. **LEAVES** opposite, sessile above but distinctly petiolate on lower portion of stem, petioles only obscurely ciliate, ovate-lanceolate to lanceolate, 4–7 × 0.5–2.4 cm; base broadly rounded to subcordate. **INFL** pedicellate, with flowers solitary in the axils of the leaves. **FLOWER** calyces green, 0.5–1 cm; corollas yellow, broad. **FRUIT** globose, 4–6 mm long. $2n = 34$. [*L. ciliata* L. var. *validula* (Greene) Kearney & Peebles; *Steironema validulum* Greene]. Moist meadows, stream banks, and shorelines. NMEX: McK, SJn. 1800–2500 m (5900–8100'). Flowering: Jun. Fruit: Jul–Sep. Widely distributed across the eastern half of North America but uncommon in the Southwest. *Lysimachia hybrida* shows a clear relationship to the widespread

species *L. ciliata*, from which it differs in having narrower, less broadly ovate leaves, and less prominently ciliate petioles. Although both are currently recognized at the species level, future genetic analysis may suggest that *L. hybrida* be better treated as a subspecies or variety of *L. ciliata*.

Primula L. Primrose

(Latin *primus*, the first, referring to the early spring blooming time) **LEAVES** usually in a single basal rosette, simple, linear, broadly lanceolate to cuneate, pubescent or glabrous, farinose in some species. **INFL** an umbel subtended by 1–several bracts, solitary to more than 15 flowers per umbel, some species heterostylous with pin (long-styled) and thrum (short-styled) flowers, other species homostylous; pedicellate. **FLOWER** calyces broadly campanulate to cylindric, more or less 5-angled, lobed from 1/4 the length to near the middle; corollas pink, rose, violet, or rarely white in mutants, campanulate, limb 5-lobed, lobes 2-cleft to entire, margin usually entire in North American species. **FRUIT** cylindric or ellliptic in our species, equal to or longer than the calyx. **SEEDS** numerous, somewhat quadrate, ovate or oblong, usually less than 1 × 1 mm. $x = 9, 11$ (in North American species). About 500 species, mostly indigenous to the north-temperate zone, with only a few outliers in the mountains of Africa (Ethiopia), tropical Asia, Central and South America.

1. Leaves somewhat fleshy, broadly or narrowly lanceolate to spatulate; involucral bracts unequal in size; plants usually over 20 cm tall and rankly aromatic; higher mountains ..... ***P. parryi***
1′ Leaves thin, spatulate to elliptic; involucral bracts more or less equal in size; plants less than 20 cm tall, hanging garden communities ..... ***P. specuicola***

Primula parryi A. Gray (for Charles Parry, early Colorado botanist) Parry's primrose. Plants robust, rosettes single but often clumped; vegetative parts lacking farina. **LEAVES** somewhat succulent, with a skunky odor, oblanceolate to oblong-obovate, almost entire to remotely denticulate, petioles broadly winged. **INFL** scape 15–50 cm long, 5–25-flowered, pedicels often unequal, 0.3–1.5 cm. **FLOWERS** heterostylous; calyx green, often purple-tinged, cylindrical to campanulate, 0.8–1.5 cm; corolla magenta, tube 0.5–2 cm, limb 1–2.5 cm. **FRUIT** broadly cylindrical, equal to the calyx. $2n = 44$. Subalpine and alpine bogs, streamsides, and wet meadows. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; UTAH. 2392–4115 m (7900–13500′). Flowering: Jun–Jul. Fruit: Aug–Sep. Western United States from Idaho to Arizona, east to Colorado and New Mexico. This is the most widespread species of primrose in the western United States; it is particularly abundant in Colorado. *Primula parryi* is relatively uncommon in Arizona and New Mexico, where it occurs only on the highest peaks.

Primula specuicola Rydb. (cave, referring to its preferred habitat of alcove hanging gardens) Cave primrose, Easterflower. Plants of medium stature, rosettes single, vegetative parts heavily farinose. **LEAVES** with petioles broadly winged, thin, spatulate, sinuate-dentate on the margins. **INFL** scape to 25 cm long, 6–25-flowered, pedicels erect, 1–3 cm. **FLOWERS** heterostylous; calyx green, campanulate, 3–5 mm; corolla lavender, tube 0.8–1 cm, 2× length of calyx, limb 1–1.6 cm. **FRUIT** elliptic, more or less equal to calyx, occasionally exserted. $2n = 18$. [*P. hunnewellii* Fernald] Moist seepage areas on carbonate-rich sandstones in canyons along the Colorado River and its tributaries. ARIZ: Apa; UTAH. 1006–2057 m (3300–6800′). Flowering: Apr–Jun. Fruit: Aug–Sep. Arizona and Utah.

RANUNCULACEAE Juss. CROWFOOT or BUTTERCUP FAMILY

Bruce D. Parfitt and Alan T. Whittemore

Perennial or annual herbs, sometimes woody or herbaceous climbers, often rhizomatous. **LEAVES** with blades entire, toothed, or lobed, simple or variously compound, basal and/or cauline, alternate or opposite (rarely whorled), petioles usually present, often proximally sheathing; stipules present or absent. **INFL** terminal or axillary, racemes, cymes, umbels, panicles, or spikes, or flowers solitary, pedicels present or absent. **FLOWERS** actinomorphic or zygomorphic, bisexual (sometimes unisexual in *Thalictrum*, *Clematis*, and some Asian genera), inconspicuous or showy; sepals 3–6 (–20), distinct, often petaloid and colored, occasionally spurred; petals 0–26, distinct, greenish, white, blue, purple, yellow, pink, or red, usually bearing nectaries, planar, cup-shaped, funnel-shaped, or spurred, showy or reduced to minute stalked nectaries; stamens 5–many, distinct, free; staminodes present only in *Aquilegia* and *Clematis*; pistils 3–many per flower (1 in *Actaea* and genera not in the flora), ovary superior, styles and stigmas 0–1 per pistil, often persistent as a beak in fruit. **FRUIT** an aggregate of achenes or follicles (rarely utricles, capsules, or solitary berry), achenes often in globose to cylindric heads. **SEEDS** 1–many per ovary. About 60 genera with 1700 species worldwide. Species cultivated in *Aquilegia*, *Delphinium*, *Clematis*, *Trollius*, and other genera; weedy species in *Ceratocephalus* and

Ranunculus. Flowers may begin to open before the floral organs have achieved mature size and morphology; use only mature flowers with dehisced anthers to determine diagnostic characteristics (especially measurements) (Flora of North America Editorial Committee 1997).

1. Flowers zygomorphic, blue to white; pistils 3 (–5) per flower; fruits several-seeded follicles ..... (2)
1′ Flowers actinomorphic, blue, white, yellow, green, or red; pistils 1 or 4–many per flower (2–6 in *Thalictrum alpinum*); fruit an aggregate of 1-seeded achenes or utricles, or several-seeded follicles or a berry ..... (3)

2. Upper (adaxial) sepal hood- or helmet-shaped; petals completely hidden by colored calyx ..... ***Aconitum***
2′ Upper (adaxial) sepal spurred; petals at least partly exserted from colored calyx ..... ***Delphinium***

3. Fruit a berry, pistil 1 per flower ..... ***Actaea***
3′ Fruit an aggregate of achenes, utricles, or follicles, pistils 2–many per flower ..... (4)

4. Plants annual, scapose, from a slender taproot; flowers solitary, relatively inconspicuous; fruit an aggregate of achenes, many (more than 20) per flower ..... (5)
4′ Plants usually perennial, aerial (or aquatic) stems elongated, leafy (or if scapose or nearly so and perennial, then inflorescence a raceme or flowers showy with yellow petals); flowers few to many per stem, or if solitary then showy; fruits achenes, utricles, follicles, or a berry, 1–many per flower ..... (6)

5. Plants gray-tomentose; leaves ternate to biternate with linear lobes; achenes in globose to thick-cylindric aggregate ..... ***Ceratocephalus***
5′ Plants glabrous; leaves entire, linear or very narrowly oblanceolate; achenes in long, tapered, slender aggregate.. ..... ***Myosurus***

6. Petals prominent, spurred; fruit aggregate of follicles, 5 per flower ..... ***Aquilegia***
6′ Petals (if present) planar, sometimes with a cupped nectary near the base; fruit an aggregate of achenes, utricles, or follicles ..... (7)

7. Fruit a several-seeded aggregate of follicles, 4–15 per flower ..... (8)
7′ Fruit an aggregate of 1-seeded achenes or utricles, usually many per flower (2–6 in *Thalictrum alpinum*; 15–16 in *Trautvetteria*) ..... (9)

8. Leaves simple, blade often lobed 1/2–3/4 its length, margins entire, crenate, or toothed; petals absent ..... ***Caltha***
8′ Leaves palmately compound or divided to base; petals usually inconspicuous ..... ***Trollius***

9. Sepals valvate, 4; leaves all cauline and opposite; stems ± woody vines, or if not woody then sepals petaloid, violet-blue or pink (rarely white), more than 25 mm long ..... ***Clematis***
9′ Sepals imbricate, 3–9, if sepals 4 then less than 15 mm long and/or not violet-blue or pink; leaves basal, or basal and cauline, alternate (leaflike involucral bracts alternate, opposite, or whorled); stems herbaceous ..... (10)

10. Plants with whorled or paired (opposite) involucral bracts, these leaflike (sepals petaloid, white, violet-blue, or rarely white) ..... ***Anemone***
10′ Plants without whorled or paired involucral bracts (rarely a pair of opposite, unlobed leaves in *Ranunculus alismifolius* and *R. flammula* with green sepals and showy yellow petals); cauline leaves (if present) alternate ..... (11)

11. Petals present, white or yellow; inflorescences simple or compound cymes or flowers solitary ..... ***Ranunculus***
11′ Petals absent; inflorescences panicles, racemes, or corymbs ..... (12)

12. Leaves pinnately or ternately compound, leaflets less than 3 cm wide; flowers commonly unisexual (bisexual in scapose, racemose *T. alpinum*) ..... ***Thalictrum***
12′ Leaves simple, 8–30 (–40) cm wide; flowers bisexual ..... ***Trautvetteria***

Aconitum L. Monkshood, Aconite, Wolfsbane

(for the ancient Black Sea port Aconis) Perennial herbs with tubers or elongate, fascicled roots, glabrous to pubescent. **STEMS** erect or reclining. **LEAVES** basal and cauline, alternate; blade pentagonal in outline, deeply palmately divided into 3–7 segments; ultimate segments narrowly elliptic or lanceolate to linear, margins incised and toothed. **INFL** terminal, sometimes also axillary, 2–32+-flowered racemes or panicles, 4–45 cm long, or flowers solitary; bracts leaflike, not forming involucre. **FLOWERS** zygomorphic, bisexual; sepals 5, usually blue (sometimes white to yellowish); sepals 5, lower sepals (pendents) 2, planar, 6–20 mm long; lateral sepals 2, round-reniform; upper sepal (hood) 1, saccate,

arched, crescent-shaped or hemispheric to rounded-conic or tall and cylindric, usually beaked, 10–50 mm long; petals 2–5, blue to whitish, bearing near apex a capitate to coiled spur with a nectary concealed inside sepal-hood; stamens 25–50; filaments with base expanded; staminodes absent between stamens and pistils; pistils 3 to 5, each with 10–20 ovules; styles filiform. **FRUIT** aggregate, sessile, oblong follicles; fruit walls prominently transversely veined; beak straight to curved, 2–3 mm. $x = 8$. About 100 species in North America south into Mexico, Eurasia, and North Africa. The distinctive "monk's hood" upper sepal distinguishes *Aconitum* from all other genera. *Aconitum* contains poisonous diterpene alkaloids historically used as medicines and as arrow or spear poisons. *Aconitum* extracts appear to have been the most widely used poison to hunt game.

Aconitum columbianum Nutt. **CP** (of the Columbia River region) Columbine monkshood. Roots tuberous; tuber to 60 × 15 mm, parent tuber connected with 1 (rarely 2) daughter tubers by very short rhizome. **STEMS** erect and stout to weak and reclining, 2–30 dm long, glabrous below inflorescence; bulbils absent from leaf axils and inflorescences. **LEAVES** (cauline) with blade 5–20 cm wide, deeply 3–5 (–7)-divided, segment margins variously incised and toothed. **INFL** pilose. **FLOWERS** commonly blue, sometimes white, cream-colored, or blue-tinged at sepal margins, 18–50 mm long from tips of pendent sepals to top of hood; pendent sepals 6–16 mm long, hood conic-hemispheric, hemispheric, or crescent-shaped, 11–34 mm from receptacle to top of hood, 6–26 mm wide from receptacle to beak apex; pistils 3 per flower. **FRUIT** 12–20 mm long. $2n = 16, 18$. [*A. columbianum* var. *ochroleucum* A. Nelson, *A. columbianum* subsp. *pallidum* Pipe; *A. geranioides* Greene; *A. infectum* Greene; *A. leibergii* Greene, *A. mogollonicum* Greene, *A. noveboracense* A. Gray]. Moist places in riparian, meadow, or forest of alder-willow, pine–Douglas-fir, oak, aspen, spruce-fir. ARIZ. Apa; COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, SJn; UTAH. 2300–3550 m (7600–11600'). Flowering Jun–Sep. British Columbia to South Dakota, south to California, Arizona, New Mexico, and Mexico; disjunct in Iowa, Wisconsin, Ohio, and New York. Ours are **subsp. *columbianum***, extremely variable within populations and groups of populations.

Actaea L. Baneberry, Necklaceweed, Cohosh, Bugbane

(*aktea*, ancient Greek name for elder, a plant with compound leaves) Perennial herbs from caudices about 1 cm thick, glabrous to puberulent. **STEMS** erect to ascending, 0–few-branched. **LEAVES**: basal leaves reduced to clasping scales 0.8–4 cm long; cauline leaves alternate, compound, blades broadly ovate to reniform in outline, 1–3 times ternate or 1–3 times pinnate, leaflets ovate to narrowly elliptic, 0–3-lobed, margins sharply cleft, irregularly coarsely dentate. **INFL** usually terminal, 20–50-flowered racemes, 2–17 cm long; bracts leaflike or absent, not forming an involucre. **FLOWERS** actinomorphic, bisexual; sepals 3–5, whitish green, planar, orbiculate, 2–4.5 mm long; petals 4–10, cream-colored, planar, spatulate to obovate, 2–4.5 mm long, glabrous; nectary absent; stamens 15–50, filaments filiform; staminodes absent between stamens and pistils; pistil 1, with several ovules; style absent or nearly so. **FRUIT** a sessile, broadly ellipsoid to nearly globose berry, fruit wall smooth; beak none, stigma appearing essentially sessile on fruit (short beak apparent on immature fruit). $x = 8$. About eight species; temperate to cool forests throughout the Northern Hemisphere.

Actaea rubra (Aiton) Willd. (red) Red baneberry. **LEAVES** with leaflets abaxially glabrous or pubescent. **INFL** at anthesis ± densely flowered, as long as wide or longer; elongating in flower. **FLOWER** petals acute to obtuse at apex; stigma nearly sessile, 0.7–1.2 mm diameter during anthesis, much narrower than ovary. **FRUIT** red or white, widely ellipsoid to spherical, 5–11 mm long; pedicel dull green or brown, filiform, much thinner than axis of raceme, 0.3–0.7 mm diameter. **SEEDS** 2.9–3.6 mm long. $2n = 16$. [*A. spicata* L. var. *rubra* Aiton; *A. arguta* Nutt., *A. eburnea* Rydb., *A. rubra* subsp. *arguta* (Nutt.) Hultén; *A. neglecta* Gillman; *A. rubra* var. *dissecta* Britton; *A. viridiflora* Greene]. Moist, shaded areas in forests of aspen, ponderosa pine, Douglas-fir, spruce, spruce-fir, riparian areas. ARIZ. Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 2300–3400 m (7500–11200'). Flowering: May–Jun. Alaska to Maine, south to California, Arizona, New Mexico, and New Jersey.

Anemone L. Windflower, Anemone, Thimbleweed

(Greek *anemos*, wind) Perennial herbs with rhizomes, caudices, or tubers, glabrous to hairy. **STEMS** erect, usually unbranched below inflorescence. **LEAVES** basal (involucre also leafy), simple or compound; blades reniform to obtriangular or lanceolate in outline, lobed or parted or undivided, segments or lobes filiform to broadly ovate, oblanceolate, or rhombic, margins entire, divided, or variously toothed. **INFL** a terminal 2–9-flowered cyme to 60 cm long, or an umbel, or flower solitary; involucres leaflike, opposite or whorled in 1–3 tiers, the primary tier subtending inflorescences, the secondary and tertiary tiers (when present) subtending branches or single flowers, involucral leaves (bracts) 2–7 (–9), closely subtending or distant from flowers. **FLOWERS** actinomorphic, bisexual; sepals 4–20 (–27), white, purple, blue, green, yellow, pink, or red, planar, linear to oblong or ovate to obovate, 3.5–40 mm long, glabrous to puberul sericeous or pilose; petals usually absent (reduced petals in *A. patens*, planar, obovate to elliptic, 1.5–2 mm long);

tary present; stamens 10–200; filaments filiform or somewhat broadened at base; staminodes absent; pistils many, each with 1 ovule; style linear-subulate to filiform. **FRUIT** aggregate, sessile or stalked head of ovoid to obovoid achenes, fruit wall not veined; beak straight or curved, 0.5–40 (–50) mm long (sometimes rudimentary), often plumose. $x = 7, 8$. [*Anemonastrum* Holub; *Pulsatilla* Mill.]. About 150 species nearly worldwide, especially in cooler temperate and Arctic regions. An acrid oil in many species of *Anemone* causes severe topical and gastrointestinal irritation but becomes harmless upon drying.

1. Sepals (18–) 20–40 mm long; involucral leaves connate, sessile; achene beak plumose, 20–40 mm long (on mature fruit) ..... ***A. patens***
1' Sepals 5–12 (–15) mm long; involucral leaves distinct, petioled or sessile; achene beak glabrous, 0.3–6 mm (on mature fruit) ..... (2)

2. Involucral leaves clearly petioled, petioles terete, often with an adaxial groove, uninterrupted portion of blades (4–) 6 mm wide or more ..... ***A. cylindrica***
2' Involucral leaves sessile, or if petioled then petioles flattened or winged at least distally, uninterrupted portion of blades 1.5–3 (–4.3) mm wide or less ..... ***A. multifida***

Anemone cylindrica A. Gray (cylindric, for the shape of the heads of achenes) Long-headed anemone, thimbleweed, candle anemone. **STEMS** (14–) 28–70 (–80) cm tall. **LEAVES** (basal) (2–) 5–10 (–13), ternate; petiole 9–21 cm long; terminal leaflet broadly rhombic to oblanceolate, crenate, or serrate and deeply incised on distal 1/2, strigose, more so abaxially; lateral leaflets 1–2 times parted and -lobed; uninterrupted portion of blades 4–10 (–13) mm wide. **INFL** a 2–8-flowered cyme or flower solitary, sometimes appearing umbel-like; involucral leaves 3–7 (–9), distinct, ± similar to basal leaves, 2 (–3)-tiered (can appear 1-tiered), ternately compound or divided, petioled; petioles terete, often with an adaxial groove; leaflets or major segments oblanceolate, cuneate, 2–3-lobed, lacerate, serrate, puberulous, more so abaxially, the various lobes and teeth very unequal in length, uninterrupted portion of blades (4–) 6–10 (–15) mm wide. **FLOWER** sepals 4–5 (–6), green to whitish, 5–12 (–15) × 3–6 mm; petals absent; stamens 50–75. **FRUIT** a head of cylindric achenes; achene body ovoid, (1.8–) 2–3 × 1.5–2 mm, woolly; beak usually recurved, (0.3–) 0.5–1 mm, hidden by achene indument, glabrous. $2n = 16$. Montane forest, spruce-fir. COLO: Arc, LPl, Hin. 2350–2600 m (7700–8600'). Flowering: Jun–Jul. British Columbia to Quebec and Maine, south to Pennsylvania, Illinois, Kansas, New Mexico, and Arizona. Used by Native Americans for headaches, sore eyes, and bad burns; also as a psychological aid and relief for tuberculosis.

Anemone multifida Poir. (much cleft, referring to the leaves) Cut-leaved anemone. **STEMS** 3–70 cm tall. **LEAVES** (basal) 3–8 (–10), 1–2-ternate; petiole (1.5–) 4–14 cm long; terminal leaflet broadly and irregularly rhombic to obovate in outline, deeply divided into narrow lobes, abaxially hairy, adaxially glabrous to hairy; lateral leaflets (2–) 3 times parted; uninterrupted portion of blades (1.5–) 2–3.5 (–5) mm wide. **INFL** a 2–7-flowered cyme or flower solitary; involucral leaves usually 3–5, distinct, ± similar to basal leaves, 1–2-tiered, ± ternately divided, sessile, or if petioled then petioles flattened or winged at least distally; blade segments linear to narrowly elliptic, usually again deeply twice-lobed, adaxially glabrous to hairy; the lobes usually unequal in length, uninterrupted portion of blades 1.5–3 (–4.3) mm wide. **FLOWER** sepals 5–9, usually (60%) purple, red, or yellow and red, sometimes (30%) green to yellow, white, or possibly blue, 5–12 × (3.5–) 5–7 (–9) mm; petals absent; stamens 50–80. **FRUIT** a spheric head of achenes; achene body irregularly elliptic, flat, 3–4 × 1.5–2 mm, woolly; beak ± straight and distally recurved or strongly hooked, 1–6 mm, glabrous. $2n = 32$. [*A. globosa* Nutt. ex A. Nelson; *A. multifida* var. *hirsuta* C. L. Hitchc.; *A. multifida* var. *hudsoniana* DC.] Rock outcrops, gravelly hills and ridges, montane meadows, aspen, spruce-fir, and alpine. COLO: Arc, Hin, LPl, RGr, SJn; UTAH. 1850–3650 m (6100–12000'). Flowering: May–Jul. Alaska to Newfoundland, south to New York, Wisconsin, Nebraska, New Mexico, Utah, Nevada, California; South America. Although var. *multifida* and var. *saxicola* B. Boivin might be expected in our area, we are unable to consistently distinguish varieties among the available specimens. Used by Native Americans as an antirheumatic, cold remedy, nosebleed cure, general panacea, and to relieve headaches and kill lice and fleas.

Anemone patens L. (spreading) Pasqueflower, prairie-crocus. **STEMS**, including inflorescence, 5–40 (–60) cm tall. **LEAVES** (basal) (1–) 3–8 (–10), primarily 3-foliolate; petioles 5–13 (–16) cm long; terminal leaflet obovate in outline, deeply divided into very narrow lobes, hairy (rarely glabrous); lateral leaflets 3–4 times parted (± dichotomously); uninterrupted portion of blades 2–4 mm wide. **INFL** 1-flowered; involucral leaves usually 3, connate-clasping, dissimilar to basal leaves, 1-tiered, simple, divided almost to the base, sessile; blade segments linear-filiform, entire except sometimes with 1–2 lateral lobes, sericeous or often shaggy-villous (rarely glabrous or nearly so), the lobes ± equal in length, uninterrupted portion of blades 1–2 (–3) mm wide. **FLOWER** sepals 5–8, blue or purple to rarely nearly white,

(18–) 20–40 × (8–) 10–16 mm; petals 1.5–2 mm long; stamens 150–200. **FRUIT** a spheric to ovoid head of achenes, achene body ellipsoid to obovoid, 3–4 (–6) × about 1 mm, hairy; beak curved, 20–40 mm long, plumose. $2n = 16$. [*A. patens* var. *nuttalliana* (DC.) A. Gray; *A. patens* var. *wolfgangiana* (Besser) Koch; *Pulsatilla patens* (L.) Mill. subsp. *multifida* (Pritz.) Zämelis]. Meadows and clearings; sagebrush, Gambel's oak, ponderosa pine. COLO. Ariz. LPI. NMEX. RAr. 2000–2400 m (6600–7800'). Flowering: May–Jun. Alaska to Ontario, south to Illinois, Nebraska, and New Mexico. Eurasia. Ours is **var. *multifida*** Pritz., not to be confused with the name of a very different taxon, *A. multifida* which has mature achenes and sepals less than half the length of those in *A. patens*. Used by Native Americans to treat rheumatism, neuralgia, headaches, and lung problems; also as poultices.

Aquilegia L. Columbine

(origin uncertain; possibly Latin *aqua*, water, and *legere*, to draw or collect, from the wet habitats or abundant nectar in the spurs; or Latin *aquila*, eagle, for the talon-shaped, curved spurs of some European species) Perennial herbs with slender woody rhizomes. **STEMS** erect, usually unbranched below inflorescence, glabrous or proximally sparsely pilose. **LEAVES** basal and cauline, alternate; blades broadly ovate to reniform in outline, 1–3 times ternately compound, leaflets crenate, glabrous or sparsely pilose. **INFL** an open, terminal, 1–10-flowered cyme to 30 cm long, often viscid-pubescent, involucres absent. **FLOWERS** actinomorphic, bisexual; sepals 5, white to blue, yellow, or red, planar, narrowly ovate to oblong-lanceolate, 7–51 mm long, glabrous; petals 5, white to blue, yellow, or red, each basally forming a backward-pointing tubular spur, apex forming a planar, oblong to rounded or spatulate blade, 0–30 mm long, glabrous, nectary in the enlarged tip of spur, without a scale; stamens numerous, filaments filiform, inner stamens often modified as scalelike staminodia; pistils 5–10, each with many ovules, styles filiform. **FRUIT** aggregate, sessile cylindrical follicles, fruit wall prominently veined, styles persistent but scarcely modified in fruit. About 70 species across North America and Eurasia. The species of *Aquilegia* are polymorphic and difficult to define adequately. Some of this variability is due to introgressive hybridization. Even distantly related species of columbine are often freely interfertile, and many cases of natural hybridization and introgression are known from North America. Only the most important are mentioned below. In arid areas, *Aquilegia* species tend to form small populations that are often completely isolated from one another. This leads to local fixation of recessive genes and therefore increased variability in species such as *A. micrantha* and *A. desertorum*. In addition, mutations giving rise to spurless petals are occasionally found in many species. The floral organs (especially the spurs and stamens) continue to elongate up to anthesis, so measurements should only be taken from flowers with open anthers (Grant 1952, Miller 1978, Munz 1946, Pelton 1958).

1. Sepals 28–43 × 8–23 mm; flowers erect, blue or white ..... ***A. coerulea***
1' Sepals 7–20 × 3–6 mm; flowers erect to pendent, white, cream, blue, pink, or red ..... (2)

2. Sepals erect, scarcely longer than petal blades, green distally; spurs and distal part of sepals red; leaflets not viscid ..... ***A. elegantula***
2' Sepals spreading perpendicularly, much longer than petal blades, not green distally; spurs and sepals white, cream, blue, or pink; leaflets viscid ..... ***A. micrantha***

Aquilegia coerulea E. James **CP** (blue) Colorado blue columbine. **STEMS** 15–80 cm tall. **LEAVES** (basal) 2–3-ternate, 9–37 cm long, much shorter than stems; leaflets green adaxially, to 13–42 (–61) mm long, not viscid, primary petiolules (10–) 20–70 mm long (therefore leaflets not crowded), glabrous or occasionally pilose (very rarely very minutely viscid). **FLOWERS** erect; sepals spreading perpendicularly, white to medium or deep blue or pink, elliptic-ovate to lance-ovate, 28–51 mm long, 8–26 mm wide, apex obtuse to acute or acuminate; petals with spurs white, blue, or sometimes pink, straight to divergent, (25–) 34–70 mm long, slender, evenly tapered from base, terminal blade white, oblong or spatulate, (17–) 20–24 mm long, 5–14 mm wide; stamens 13–19 mm long. **FRUIT** 20–30 mm long, styles 8–12 mm long. $2n = 14$. [*A. coerulea* var. *daileyae* Eastw.]. Across its broad range, *A. coerulea* consists of four varieties that are mostly allopatric, with limited overlap in the Four Corners region and a few other places. Populations with the small flowers of the Rocky Mountain var. *coerulea* and the pale color of the Great Basin var. *pinetorum* are probably the result of local hybridization between these two taxa, which are otherwise distinct over their broad ranges. *Aquilegia coerulea* has been reported to hybridize with *A. elegantula* (Pelton 1957; Miller 1978) and *A. flavescens* S. Watson (Grant 1952).
Most authors have spelled the epithet *caerulea*. However, *coerulea* is the original spelling.

1. Sepals medium to deep blue; petal spurs 34–48 mm (population mean 39–45 mm); stamens 13–19 mm ..... **var. *coerulea***
1' Sepals white, pale blue, or pink; petal spurs 45–70 mm (population mean 50–58 mm); stamens 18–24 mm ..... **var. *pinetorum***

var. *coerulea* **LEAVES** 2-ternate. **FLOWER** sepals medium or deep blue, 28–43 mm long; petal spurs 34–48 mm long, petal blades (17–) 20–24 mm long; stamens 13–19 mm long. Rocky slopes or near streams, in open woodland or herbland, Gambel's oak–ponderosa pine, aspen, Douglas-fir, spruce-fir, subalpine to alpine. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NMEX: SJn; UTAH. 1850–3950 m (6000–13000'). Flowering: Jun–Aug. New Mexico to southern Wyoming.

var. *pinetorum* (Tidestr.) Payson ex Kearney & Peebles (of the pines) **LEAVES** 2–3-ternate. **FLOWER** sepals white, pale blue, or pink, (22–) 29–51 mm long; petal spurs 43–72 mm long, petal blades 20–28 mm long; stamens 17–24 mm long. Riparian; aspen-fir forest. ARIZ: Apa; COLO: LPl; UTAH. 2560–2680 m (8400–8800'). Flowering: Jun–Jul. Colorado to Utah and Arizona.

Aquilegia elegantula Greene (little elegant one) Western red columbine. **STEMS** 10–60 cm tall. **LEAVES** (basal) 2-ternate, 7–30 cm long, usually shorter than stems; leaflets green adaxially, to 11–33 mm long, not viscid; primary petiolules 17–58 mm long (therefore leaflets not crowded), glabrous or pilose. **FLOWERS** pendent; sepals erect, red proximally, yellow-green distally, elliptic-ovate, 7–11 mm long, 4–5 mm wide, apex rounded to acute; petals with spurs red, straight, 16–23 mm long, stout (at least proximally), abruptly narrowed near the middle; terminal blade yellow-green, oblong or rounded, 6–8 mm long, 3–4 mm wide; stamens 8–14 mm long. **FRUIT** 13–20 mm long, styles 13–15 mm long. Moist coniferous forests, especially along streams. Ponderosa pine and subalpine spruce-fir forests. ARIZ: Apa; COLO: Arc, Con, LPl, Hin, Min, Mon, SJn; NMEX: RAr, SJn. 2250–3950 m (7400–13000'). Flowering: May–Jul. Northern Utah and Colorado to northern Mexico. Reported to hybridize with *A. coerulea* (Pelton 1957; Miller 1978) and *A. chrysantha* A. Gray (Munz 1946).

Aquilegia micrantha Eastw. **CP** (small-flowered) Alcove columbine. **STEMS** 30–60 cm tall. **LEAVES** (basal) 2–3-ternate, 10–35 cm long, much shorter than stems; leaflets green adaxially, to 13–32 mm long, viscid; primary petiolules 21–64 mm long (therefore leaflets not crowded), glandular-pubescent or glandular. **FLOWERS** erect or nodding; sepals spreading perpendicularly, white, cream, blue, or pink, oblong-lanceolate, 8–20 mm long, 3–6 mm wide, apex acuminate to obtuse; petals with spurs white or colored like sepals, straight or divergent, 15–30 mm long, slender, evenly tapered from base or occasionally abruptly narrowed near the middle; terminal blade white or cream, oblong, 6–10 mm long, 3–7 mm wide; stamens 9–14 mm long. **FRUIT** 10–20 mm long, styles 8–10 mm long. [*A. flavescens* S. Watson var. *rubicunda* (Tidestr.) S. L. Welsh; *A. micrantha* var. *mancosana* Eastw.; *A. navajonis* A. Nelson]. Sandy soils in hanging garden communities, seepy rock walls of canyons. ARIZ: Apa, Nav; UTAH. 1150–2050 m (3700–6700'). Flowering: Apr–Jun. Arizona to northern Utah and Colorado.

Caltha L. Marsh-marigold

(Greek name for some yellow-flowered plants) Perennial herbs with thick caudices 0.5–2 cm diameter or slender stolons, glabrous. **STEMS** erect or ascending, 0–few-branched. **LEAVES** basal and often cauline, alternate, simple; blade oblong-ovate to orbiculate-reniform or cordate, unlobed, margins entire, dentate, or crenate. **INFL** a terminal or axillary, 2–6-flowered cyme to 30 cm long, or flower solitary; bracts leaflike, not forming involucre. **FLOWERS** actinomorphic, bisexual; sepals 5–12, white, pinkish, yellow, or orange, planar, oval-orbiculate to narrowly obovate, 4–23 mm long; petals and nectary absent; stamens 10–40, filaments filiform; staminodes absent between stamens and pistils; pistils 5–many, each with 15–35 ovules; style stout, recurved at tip. **FRUIT** sessile or stipitate, linear-oblong to ellipsoid follicles, fruit walls prominently veined or not; beak straight or weakly curved, 0.2–2 mm long. $x = 8$. Ten species, mainly temperate wetlands, worldwide.

Caltha leptosepala DC. **CP** (having narrow sepals) White marsh-marigold. Plants 2–30 cm tall. **STEMS** with aboveground portion leafless or with 1 leaf, erect. **LEAVES** usually all basal; blade oblong-ovate to orbiculate-reniform, largest 1.5–11.5 (–15) × 1–13 cm, margins entire or crenate to dentate. **INFL** 1–2 (–4)-flowered. **FLOWERS** 15–40 mm diameter; sepals adaxially white, abaxially bluish, 8.5–23 mm long. **FRUIT** 4–15, ± spreading, short-stipitate or sessile, linear-oblong; bodies 10–20 × 3–4.5 mm. **SEEDS** elliptic, 1.9–2.5 mm long. $2n = 48, 96$. [*Caltha biflora* DC.; *C. uniflora* Rydb.; *Psychrophila leptosepala* (DC.) W. A. Weber]. Open riparian, wet meadows, and marshy edges of lakes, montane to alpine. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 3100–3900 m (10200–12800'). Flowering: May–Sep. Alaska to Arizona, California, and New Mexico.

Ceratocephalus Pers. Curveseed, Butterwort

Alan T. Whittemore and Bruce D. Parfitt

(spiky head) Annual herbs, scapose, with a slender taproot, tomentose. **STEMS** absent. **LEAVES** all basal; blade broadly spatulate in outline, 1–2 times dissected; ultimate segments linear, margins entire. **INFL** a solitary flower at

the end of a scape without involucre. **FLOWERS** actinomorphic, bisexual; sepals 5, green (sometimes almost hidden in white tomentum), planar, elliptic, 3–6 mm long, villous; petals 5, yellow, planar, elliptic to oblanceolate or obovate, 3–5 mm long, glabrous, nectary covered by a basally attached scale; stamens 10–20, filaments filiform, staminodia absent between stamens and pistils; pistils 20–50, each with 1 ovule, styles linear-subulate. **FRUIT** sessile, ellipsoid 3-chambered achenes in long-cylindrical heads, fruit wall thick, not veined, beak straight, lanceolate, spine-tipped, 2–2.5 mm long. $x = 7$. Ten species, Eurasia and North Africa; introduced in Australia and North America. Often treated as a subgenus of *Ranunculus*, but may be more closely related to *Myosurus*. The structure of the achene in *Ceratocephalus* is unique, with two empty lateral sacs adjacent to the seed.

Ceratocephalus testiculatus (Crantz) Roth (having testicles, actually a pair of empty, round sacs at base of achene) Curveseed butterwort, bur butterwort, little bur, testiculate buttercup. **STEMS** erect or ascending, not rooting nodally, 0.5–8 cm tall, villous, not bulbous-based; roots never tuberous. **LEAVES** broadly spatulate in outline, 0.9–3.8 cm long, 0.5–1.5 cm wide, 1–2 times dissected, segments linear, margins entire, apices obtuse to acuminate. **FLOWER** sepals spreading, 3–6 mm long, 1–4 mm wide, villous; petals 5, yellow, 3–5 mm long, 1–3 mm wide. **FRUIT** with achenes in cylindrical heads 9–16 (–20) mm long, 8–10 (–14) mm wide; the body of each achene 1.6–2 mm long, 1.8–2 mm wide, tomentose, the beak persistent, lanceolate, 3.5–4.5 (–6) mm long; receptacles glabrous. [*C. orthoceras* DC., *Ranunculus testiculatus* Crantz]. Weedy in disturbed areas in desert scrub, sagebrush, open piñon-juniper, or oak-aspen-ponderosa pine. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SIn; UTAH. 1700–2600 m (5600–8500'). Flowering: Mar–Jun. California east to Ohio and north to southern Canada; native to Eurasia. *Ceratocephalus testiculatus* is expanding its range rapidly in arid and semiarid areas of North America.

Clematis L. Clematis, Leather Flower

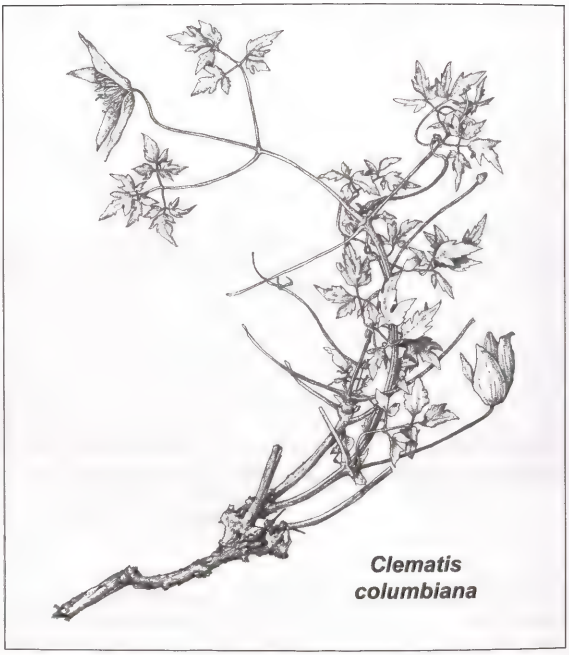
(Greek *clema*, plant shoot, ancient name of a vine) Perennial herbs with elongate rhizomes, or ± woody vines, sometimes woody only at base, glabrous or variously pubescent. **STEMS** erect or prostrate to climbing by means of tendril-like petioles, leaf rachises, and petiolules. **LEAVES** cauline, opposite, simple or compound, blade ovate in outline, undivided or 1–3-pinnately or -ternately compound; leaflets linear to lanceolate, oblanceolate, ovate, oblong, or orbiculate, lobed or unlobed, margins entire or toothed. **INFL** an axillary and/or terminal 2–many-flowered cyme or panicle to 15 cm long or flower solitary or in a fascicle; bracts leaflike or ± scalelike or absent, not forming involucre. **FLOWERS** actinomorphic, bisexual or unisexual; sepals 4 (–5), white, blue, violet, red, yellow, or greenish, planar, ovate to obovate or linear, 6–60 mm long; petals absent; stamens many; filaments filiform to flattened, sometimes staminodes with sterile anthers in pistillate flowers or between sepals and stamens of bisexual flowers; pistils 5–150, each with 1 ovule; style filiform. **FRUITS** aggregate, sessile, lenticular, nearly terete, or flattened-ellipsoid achenes, fruit wall not prominently veined; beak straight or curved, 12–110 mm long, commonly plumose. $x = 8$. About 300 species worldwide: temperate, subarctic, subalpine, or tropical. Often split into genera based on its diverse floral and vegetative morphology. Many ornamental species; *Clematis orientalis* could escape from cultivation in our area (Johnson 2001).

1. Stems herbaceous, ± erect, 0.15–0.65 m long; petioles and petiolules not tendril-like; perianth narrowly bell- to urn-shaped, ± thick, leathery ..... ***C. hirsutissima***
1' Stems ± woody, climbing or clambering vines 0.5–8 (–20) m long; petioles and petiolules often tendril-like, i.e., curling around slender objects; perianth widely bell-shaped to rotate, thin ..... (2)

2. Flowers solitary, terminal on short shoots or rarely long shoots; sepals 2.5–6 cm long; perianth violet-blue, rarely white, widely bell-shaped or tardily rotate ..... ***C. columbiana***
2' Flowers in 7–30 (–65)-flowered compound cymes; sepals 0.6–1.2 cm long; perianth white to cream, rotate, widespreading ..... ***C. ligusticifolia***

Clematis columbiana (Nutt.) Torr. & A. Gray (of the Columbia River region) Rock clematis. **STEMS** ± woody, viny, climbing or trailing, 0.5–1.5 (–3.5) m long. **LEAVES** with blades 2–3-ternate, leaflets usually very deeply 2–3-lobed, mostly lanceolate to ovate, 15–48 × 8–35 mm; lateral lobes often nearly distinct, 3–12 mm wide, glabrous or with a few long hairs near the midvein and base of blade. **INFL** terminal on short shoots or rarely terminal on long shoots, 1-flowered, with long peduncles subtended by 1–2 pairs of leaves. **FLOWERS** bisexual, ± nodding, perianth widely bell-shaped to rotate; sepals thin, ascending or tardily spreading, not connivent or connivent only in proximal 1/4, violet-blue (rarely white), lance-ovate to ovate, 25–60 mm long, abaxially nearly glabrous to sparsely pilose at least near base, adaxially glabrous, margins sparsely pilose; petaloid staminodes present between stamens and sepals. **FRUIT** flattened; beak 3.5–5 cm long. [*Atragene columbiana* Nutt.; *C. pseudoalpina* (Kuntze) A. Nelson] Rocky, open woods and thickets; riparian, montane grassland, montane shrubland, piñon-juniper, ponderosa pine, oak, Douglas-fir, aspen.

spruce-fir. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Mon, SMg; NMEX: McK, RAr, SJn; UTAH. 1350–2600 m (4400–8500'). Flowering: May–Jul. Montana south to Arizona, New Mexico, and Texas. The name *C. pseudoalpina* often has been used improperly in place of *C. columbiana.* Two intergrading varieties in western North America; if accepted, ours would be **var. *columbiana***. Used by the Thompson Indians for scabs and eczema.



Clematis hirsutissima Pursh (very hairy) Hairy clematis. ± herbaceous perennials. **STEMS** erect, not branched or viny, 1.5–6.5 m long. **LEAVES** with blades 2–3-pinnate; leaflets often deeply 2–several-lobed; lateral lobes narrowly linear to narrowly elliptic-lanceolate, 10–60 × 0.5–8 (–10) mm, nearly glabrous to densely silky-hirsute. **INFL** terminal, 1-flowered. **FLOWERS** bisexual, nodding, perianth broadly cylindric to urn-shaped; sepals thick, usually leathery, connivent at least proximally and usually much of length, very dark violet-blue or rarely pink or white, oblong-lanceolate, 25–45 mm long, abaxially hirsute, usually densely so, adaxially glabrous, margins distally ± crisped, tomentose. **FRUIT** flattened; beak 4–9 cm long. $2n = 16$. [*C. hirsutissima* var. *arizonica* (A. Heller) R. O. Erickson; *Coriflora hirsutissima* (Pursh) W. A. Weber; *Viorna arizonica* (A. Heller) A. Heller; *V. bakeri* (Greene) Rydb.; *V. eriophora* Rydb.; *V. jonesii* (Kuntze) Rydb.; *V. wyethii* (Nutt.) Rydb.]. Sagebrush, mountain brush, piñon-juniper, ponderosa pine, Douglas-fir, aspen-willow, spruce-fir, alpine. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, SJn; UTAH. 1750–3300 m (5700–10900'). Flowering: May–Jun. Washington to Montana south to Arizona and New Mexico. Density of leaf pubescence is highly variable. Ours have been treated as **var. *hirsutissima***, which intergrades extensively with var. *scottii* (Porter) R. O. Erickson, occurring to the east of our area and northward. Leaflets and larger lobes of var. *scottii* tend to be more widely spaced and broader (5–15 mm wide), but plants of *hirsutissima* from the opposite (western) side of the Four Corners region sometimes have leaf lobes as wide as 10 mm. Some Native Americans have used finely crushed leaves of this species as snuff or have used the roots to stimulate exhausted horses.

Clematis ligusticifolia Nutt. (leaves of privet, *Ligustrum*) Virgin's-bower, western white clematis, old man's beard, hierba de chivo. **STEMS** woody, viny, clambering or climbing, to 6 (–20) m long. **LEAVES** with blades pinnately 5-foliolate, 2-ternately 9-foliolate, or bipinnately 8–15-foliolate; leaflets lobed or unlobed, lanceolate to broadly ovate, (10–) 30–90 × 9–72 mm; abaxially glabrous or sparsely pilose or silky, especially on veins. **INFL** axillary on current year's stems, usually 7–30 (–65)-flowered compound cymes, often distinctly corymbiform. **FLOWERS** unisexual, staminate and pistillate on different plants (plants dioecious), not nodding; perianth rotate; sepals thin, wide-spreading, not recurved, not connivent, white to cream, obovate to oblanceolate, 6–12 mm long, abaxially and adaxially pilose, margins densely pilose. **FRUIT** flattened or nearly terete; beak 3–4.5 cm long. $2n = 16$. [*C. ligusticifolia* var. *brevifolia* Nutt.; *C. ligusticifolia* var. *californica* S. Watson; *C. neomexicana* Wooton & Standl.; *C. suksdorfii* B. L. Rob.]. Piñon-juniper, montane or riparian woodland and forest edges, canyon bottoms, hanging gardens, or scrub, clearings and pastures usually on moist slopes. ARIZ: Apa, Coc; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, SJn; UTAH. 1550–2650 m (5100–8700'). Flowering: Jun–Sep. British Columbia to Manitoba south to northwestern Mexico and east to the Dakotas. Common and widespread. Often cultivated. Used by Native Americans for boils and skin eruptions, backaches or swollen limbs, colds and sore throats, stomachaches and cramps, and protection against witches.

Delphinium L. Larkspur, Delphinium

(Greek *delphin*, for the resemblance of the spurred flower to classical Greek sculptures of dolphins) Perennial herbs, from dry and fibrous or fasciculate and ± tuberous roots. **LEAVES** basal and/or cauline, alternate; blades round to

pentagonal or reniform in outline, deeply palmately divided into 3 (–7) primary segments, ultimate segments elongate linear to oblanceolate, margins apically entire or crenate to lacerate, lobes of basal blades wider and fewer than those of cauline blades. **INFL** terminal, 2–100+-flowered racemes or few-branched panicles, 5–40 cm long or more bracteate, not forming involucre. **FLOWERS** zygomorphic, bisexual, sepals 5, usually blue to purplish (rarely white to pink; red or yellow in species outside our area); lateral and lower sepals 4, planar, lanceolate to ovate or elliptic, 8–18 mm long; upper sepal 1, spurred, 8–24 mm long; petals 5, upper petals 2, often white, spurred, bearing a nectary concealed inside sepal-spur; lower petals 2, often colored as the sepals, planar, blade ± ovate, ± 2-lobed, 2–12 mm long, conspicuously hairy, lacking nectaries; stamens 25–40, filaments proximally dilated, staminodes absent between stamens and pistils; pistils 3 (–5), each with 8–20 ovules; style filiform. **FRUIT** sessile cylindric follicles, fruit walls prominently veined or not; beak not developed, style scarcely modified in fruit. $x = 8$. About 300 species in northern temperate and Arctic habitats, also subtropical and tropical mountains in Africa. At least three Eurasian species have been cultivated in North America.

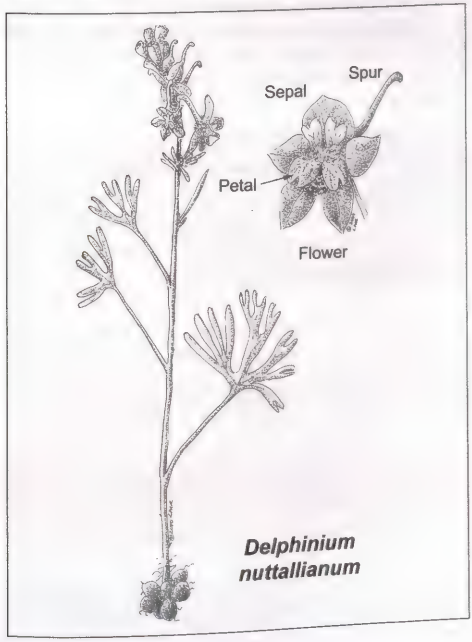
1. Proximal internodes similar in length to those of midstem; leaves largest near midstem, gradually reduced upward, midstem blades 7–10 cm broad; pedicels densely velutinous, with spreading yellow hairs, some hairs minutely glandular (use 30× lens) at apex ..... ***D. barbeyi***

1' Proximal internodes much shorter than those of midstem; leaves largest near base of stem (but sometimes absent at anthesis), often abruptly reduced upward, midstem blades 0.5–5.5 cm broad, pedicels glabrous or pubescent with recurved or arching, white hairs, not glandular (rarely some spreading, yellow, minutely glandular hairs among the recurved, white hairs in *D. nuttallianum*) ..... (2)

2. Plants pubescent (except sometimes the leaves and stem are glabrous), base of stem covered by few membranous leaf bases or scale leaves, not fibrous; roots fascicled, short, tuberous, not fibrous but often with numerous roots tomentose with root hairs ..... ***D. nuttallianum***

2' Plants glabrous or nearly so (except the flowers, bracts, and leaf blades may be pubescent), base of stem covered by coarse vein fibers persisting from previous years' leaf bases; roots (at least the main one) elongate, fibrous, dry ..... ***D. scaposum***

Delphinium barbeyi (Huth) Huth (for William Barbey, 1842–1914, Swiss botanist) Subalpine larkspur, tall larkspur, Barbey's larkspur. Roots twisted, fibrous, dry. **STEMS** 50–150 cm tall; base green, glabrous or sparsely pubescent, lower stem portion often not collected. **LEAVES** cauline, usually absent from lower 1/5 of stem at anthesis; midstem blades lacerate, 7–15 cm broad, segments usually cuneate. **INFL** a few-branched panicle or raceme; pedicels densely golden-velutinous with finely glandular hairs (use 30× lens); bracteoles 1–4 (–8) mm from flowers, 5–14 mm long. **FLOWER** sepals dark bluish purple, sparsely puberulent; lateral sepals lanceolate, sharply acuminate; lower petal blades 4–7 mm long, hairs centered at or below proximal end of notch, sparse elsewhere, white. **FRUIT** 17–22 mm long. $2n = 16$. [*D. occidentale* (S. Watson) S. Watson var. *barbeyi* (Huth) S. L. Welsh]. Subalpine and alpine, wet soils, riparian, ponderosa pine, Douglas-fir, spruce-fir, tundra, scree slopes. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SIn. UTAH. 2550–3900 m (8300–12700'). Flowering: Jun–Aug. Utah and Wyoming, south to Arizona and New Mexico. Known to hybridize with closely related species including *D. glaucum* S. Watson, which closely approaches our area from the north. Similar species could occur in our area, but they cannot be confidently segregated.



Delphinium nuttallianum Pritz. (for Thomas Nuttall, early 19th-century botanical explorer) Two-lobed larkspur. Roots fascicled, tuberous, not fibrous but often with numerous roots covered by root hairs. **STEMS** 11–45

(–70) cm tall, pubescence variable, white-recurved hairs throughout or in part; lower stem portion reddish (often whitish underground), usually long-tapered to the deep root crown, base surrounded by few membranous, brownish scale-leaves or leaf bases, not fibrous. **LEAVES** basal and cauline, present in lower 1/5 of stem at anthesis; midstem blades dissected, 1–5.5 cm broad, segments linear. **INFL** a raceme; pedicels puberulent with hairs white, short, recurved (rarely mixed with or replaced by spreading, yellow, minutely glandular hairs); bracteoles 2–8 mm from flowers, 3–7 mm long. **FLOWER** sepals usually bluish purple (rarely white) to pink, puberulent; lateral sepals oblanceolate, obtuse to acute; lower petal blades 4–11 mm long; hairs white, usually curly, and centered at proximal end of notch. **FRUIT** 7–17 mm long, 3.5–5 times longer than wide. $2n = 16$. Open coniferous woods, grassy sage scrub, meadow edges, and well-drained streamsides (generally not in very wet sites), desert scrub, sage, piñon-juniper, ponderosa pine, aspen, Gambel's oak, spruce-fir. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, San, SJn; UTAH. 1450–2950 m (4800–9700'). Flowering: (Apr–) May–Jun (–Aug). British Columbia to Montana, south to California, Arizona, New Mexico. Highly variable and often difficult to identify.

Delphinium scaposum Greene **CP** (scapose, stem naked of leaves) Tall mountain larkspur. Roots (at least the main one) elongate, fibrous, dry. **STEMS** 17–61 cm tall, glabrous; lower stem portion glaucous, usually reddish; base surrounded by ascending coarse vein fibers persisting from previous years' leaf bases. **LEAVES** all basal or nearly so; leaves present on lower 1/5 of stem (or less) at anthesis; midstem blades absent, uppermost cauline blades lobed, 0.3–1.2 cm broad, segments short-spatulate. **INFL** a raceme (panicled in one individual); pedicel glabrous (rarely with a few short, curly hairs between sepals and bracteoles); bracteoles 2–5 mm from flowers, 2–4 mm long. **FLOWER** sepals bright dark blue (rarely ± pale), glabrous to very sparsely hairy; lateral sepals oblanceolate, rounded to acute; lower petal blades 5–8 mm long, hairs nearly as dense on lobes as on the rest of blade, curly. **FRUIT** 12–16 mm long, barrel-shaped. $2n = 16$. [*D. andersonii* A. Gray var. *scaposum* (Greene) S. L. Welsh]. Desert scrub, sagebrush, grassland, piñon-juniper, or ponderosa-piñon woodland. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1500–2350 m (4900–7700'). Flowering: May–Jun. Arizona, Colorado, New Mexico, Utah. Used by Navajo and Hopi for a wash after childbirth.

Myosurus L. Mousetail

(Greek *mus*, mouse, + *oura*, tail) Annual herbs, scapose, with a slender taproot. **STEMS** absent. **LEAVES** all basal, simple, blades linear or very narrowly oblanceolate, tapering to a filiform base, entire, glabrous. **INFL** a solitary flower at the end of a scape without involucre. **FLOWERS** actinomorphic, bisexual; sepals (3–) 5 (–8), green or with scarious margins, spurred, oblong to elliptic, lanceolate or oblanceolate, 1.5–4 mm long, glabrous; petals 0–5, white, planar, linear to very narrowly spatulate, 1–2.5 mm long, glabrous, nectary present, scale absent; stamens 5–25, filaments filiform; staminodia absent between stamens and pistils; pistils 10–400, each with 1 ovule, styles filiform. **FRUIT** aggregate, sessile prismatic achenes, exposed face of achene forming a planar outer surface, sides faceted or curved by compression against adjacent achenes, fruit wall not veined, beak straight, 0.05–1.8 mm long, glabrous. $x = 8$. Fifteen species, worldwide in temperate regions.

1. Outer face of achene circular to square or broadly rhombic, 1–1.3 times higher than wide; petal claw 3 times longer than blade ..... ***M. nitidus***
1' Outer face of achene elliptic or oblong to linear, 1.5–5 times higher than wide; petal claw 1–2 times longer than blade ..... (2)

2. Beak of achene 0.05–0.4 mm, parallel to outer face of achene (strongly appressed), head of achenes thus appearing smooth ..... ***M. minimus***
2' Beak of achene 0.6–1.8 mm, diverging at a narrow angle, head of achenes thus conspicuously roughened with projecting achene beaks ..... ***M. apetalus***

Myosurus apetalus Gay (without petals) Bristly mousetail. Plants 1.5–12.5 cm tall. **LEAVES** linear or narrowly oblanceolate, 0.9–4 cm long. **INFL** scape 0.9–10.5 cm long. **FLOWER** sepals faintly 3-nerved, scarious margins narrow; petal claw 1–2 times longer than blade. **FRUIT** a head of achenes 11–33 mm long, 1.5–2.5 mm wide; achene outer face narrowly rhombic, 1–2.2 mm high, 0.4–1 mm wide, 2–5 times higher than wide; beak 0.6–1.4 mm long, 0.4–1 times longer than achene body, diverging from outer face of achene, head of achenes thus strongly roughened by projecting achene beaks. $2n = 16$. [*M. minimus* L. subsp. *montanus* G. R. Campb.]. Wet meadows, margins of lakes and intermittent ponds, mudflats and moist, sandy soils. ARIZ: Apa; COLO: Dol, Hin, LPl, Mon, SMg; NMEX: McK, RAr, SJn. 2000–2700 m (6600–8900'). Flowering: May–Jun. Fruit: May–Jul. California and Oregon, east to New Mexico, north to southern Saskatchewan. Ours are **var. *montanus*** (G. R. Campb.) Whittem. (of Montana), for which the illegitimate name *M. aristatus* Benth. subsp. *montanus* (G. R. Campb.) D. E. Stone ex H. Mason has been used. Our most common mousetail.

Myosurus minimus L. (very small, minimal) Tiny mousetail. Plants 4–16.5 cm tall. **LEAVES** narrowly oblanceolate or linear, 2.2–11.5 cm long. **INFL** scape 1.8–12.8 cm long. **FLOWER** sepals faintly or distinctly 3–5-nerved, scarious margins narrow or none; petal claw 1–2 times longer than blade. **FRUIT** a head of achenes 16–50 mm long, 1–3 mm wide; achene outer face narrowly rhombic to elliptic or oblong, 0.8–1.4 mm high, 0.2–0.6 mm wide, 1.5–5 times higher than wide; beak 0.05–0.4 mm long, 0.05–0.3 times longer than achene body, parallel to outer face of achene (appressed), head of achenes thus appearing smooth. $2n = 16$. Muddy margins of lakes, stock ponds, and dry washes; greasewood, piñon-juniper. ARIZ: Coc; COLO: Arc, LPl, Mon; NMEX: McK, RAr, San, SIn. 1850–2300 m (6000–7500'). Flowering: Apr–Jun. Fruit: May–Jun. Southern Canada to northern Mexico and across the continent, except the Great Lakes states, New England, the Appalachians, and Florida. Common. May be found growing with *M. apetalus*.

Myosurus nitidus Eastw. (shiny) Western mousetail. Plants 1–4 cm tall. **LEAVES** linear or very narrowly oblanceolate, 0.6–2.4 cm long. **INFL** scape 0.5–2.4 cm long. **FLOWER** sepals sometimes strongly nerved, scarious margin narrow or broad; petal claw 3 times longer than blade. **FRUIT** with heads of achenes 8–17 mm long, 2–3 mm wide; achene outer face circular to rhombic, 0.8–1 mm high, 0.6–0.9 mm wide, 1–1.3 times higher than wide; beak 0.7–1 mm long, 0.8–1.2 times longer than outer face of achene, diverging (sometimes weakly) from outer face of achene, head of achenes thus ± roughened by projecting achene beaks. [*M. egglestonii* Wooton & Standl.] Ephemeral wet places under sagebrush or in shallow depressions in bedrock; woodlands with ponderosa pine and Gambel's oak. ARIZ: Apa. COLO: LPl, Mon. 2100–2500 m (7400–8100'). Flowering: May or Jun. Northern Arizona and New Mexico, southwestern edge of Colorado. Very infrequently collected.

Ranunculus L. Buttercup, Crowsfoot

(Latin *rana*, frog, + *unculus*, little, alluding to the wet places where many species occur) Annual or perennial herbs with fibrous or tuberous roots, caudices, rhizomes, stolons, or bulbous stem bases. **STEMS** erect to prostrate. **LEAVES** basal, cauline, or both, alternate (or a distal pair opposite in *R. alismifolius* and *R. flammula*), simple and entire or variously cleft or divided, or once ternately or pinnately compound. **INFL** terminal or sometimes axillary in creeping plants, the flowers solitary or in an open few-flowered cyme. **FLOWERS** actinomorphic, bisexual, sepals 3–5 (–6), green, yellow, or purple, planar, narrowly to broadly elliptic, ovate, or nearly round, petals 0–26 (usually 5), commonly yellow, sometimes white or red, planar, obovate to oblanceolate or elliptic, with a basal adaxial nectary covered by a scale, or the scale sometimes poorly developed; stamens (5 or) 10–many, filaments filiform, without staminodia between stamens and pistils; pistils 5–many, each with 1 ovule, styles linear, sometimes lacking. **FRUIT** aggregate, sessile, globose or discoid achenes, fruit wall not prominently veined (transversely wrinkled in one var. of *R. sceleratus*), styles scarcely modified in fruit. About 300 species, worldwide except the lowland tropics. Most *Ranunculus* species are poisonous to stock; when abundant, they may be troublesome to ranchers. A few species have acrid juice and were formerly used as vesicatories in medicine (Cook 1966; Johansson 1998).

1. Sepals covered with long, dense, brown hairs; distal leaves and bracts 3-crenate or shallowly 3-lobed apically, otherwise entire ..... ***R. macauleyi***
1' Sepals glabrous or with colorless hairs; leaves not as above ..... (2)

2. All leaves simple and unlobed ..... (3)
2' Some or all leaves deeply lobed or compound ..... (6)

3. Achene walls papery, longitudinally ribbed, glabrous; leaf apices broadly rounded to truncate, margins crenate ..... ***R. cymbalaria***
3' Achene walls thick, smooth, glabrous or sometimes pubescent; leaf apices acuminate to rounded-obtuse, margins entire or finely toothed ..... (4)

4. Stems rooting nodally, erect to prostrate ..... ***R. flammula***
4' Stems never rooting nodally, erect or ascending ..... (5)

5. Petals 2–3.8 mm broad; nectary scales glabrous; head of achenes 3–7 mm long ..... ***R. alismifolius***
5' Petals 5–12 mm broad; nectary scales usually ciliate; head of achenes 7–12 (–20) mm long ..... ***R. glaberrimus***

6. Stems creeping and rooting at nodes, or floating in water (then rootless) ..... (7)
6' Stems upright, or if decumbent then rooting only at the base ..... (11)

7. Basal and lower cauline leaves 3-foliolate; upper cauline leaves deeply parted or compound; achene discoid, much thinner than broad, 2.4–3.2 mm long ..... (8)

7' All leaves 3-parted or filiform-dissected, never clearly 3-foliolate; without differentiated basal leaves; achenes compressed-ellipsoidal to discoid, plump, 1–1.8 mm long ..... (9)

8. Petals 6–18 mm long, 5–12 mm wide; achene beak curved ..... ***R. repens***
8' Petals 4–6 mm long, 3.5–5 mm wide; achene beak straight ..... ***R. macounii***

9. Petals white or white with yellow claws; achene with strong transverse ridges; stems floating in water; lower cauline leaves (or all leaves) divided into capillary segments ..... ***R. aquatilis***
9' Petals yellow; achene smooth; stem reclining on drying mud or sometimes floating in water; basal leaves absent, cauline leaf blades reniform to circular or broadly flabellate, deeply 3-lobed or 5-parted ..... (10)

10. Leaf blades 0.3–1.2 cm long, deeply 3-lobed or -parted, terminal segment entire or distally crenulate; style 0.1–0.2 mm ..... ***R. hyperboreus***
10' Leaf blades 0.6–7.3 cm long, 3-parted, terminal segment again lobed or dissected; style 0.2–1.2 mm ..... ***R. gmelinii***

11. Style absent, stigma sessile; achene margins thick and corky; emergent aquatic, sometimes also found on very wet soil ..... ***R. sceleratus***
11' Style present; achene margins ridges or narrow wings, or else differentiated margins not evident; wet or dry soil (*R. macounii* sometimes emergent from shallow water) ..... (12)

12. Achene strongly flattened, discoid, width 3–15 times thickness; nectary scale free from the petal for at least 1/2 of its length, forming a free flap; basal leaves lobed, divided, or compound ..... (13)
12' Achene weakly compressed, thick-lenticular, width 1.2–2 times thickness; nectary scale joined to the petal on 3 sides, forming a pocket; basal leaves simple, lobed or divided, never compound ..... (15)

13. Achene beak 1–2.5 mm long, strongly curved; basal leaves 3-parted (rarely 3-foliolate) ..... ***R. uncinatus***
13' Achene beak 0.6–1.2 mm long, straight; basal leaves 3-foliolate ..... (14)

14. Petals 2–4 mm long, 1–2.5 mm wide; heads of achenes short-cylindrical, 5–7 mm wide ..... ***R. pensylvanicus***
14' Petals 4–6 mm long, 3.5–5 mm wide; heads of achenes globose to ovoid, 7–10 mm wide ..... ***R. macounii***

15. Some or all basal leaves simple and unlobed ..... (16)
15' All basal leaves deeply 3-lobed or -parted ..... (19)

16. Head of achenes globose; stems prostrate or ascending; basal leaves entire (rarely with 3 broad, shallow crenations) ..... ***R. glaberrimus***
16' Head of achenes ovoid or cylindrical; stems erect or nearly so; basal leaves crenate (with more than 3 crenations), the innermost basal leaves sometimes lobed or parted ..... (17)

17. Sepals glabrous; petals 1.5–3.5 mm long, 1–2 mm wide ..... ***R. abortivus***
17' Sepals pilose; petals 4–13 mm long, 2–13 mm wide ..... (18)

18. Sepals 3–5 mm long, 2–3 mm wide; leaf base acute to rounded; nectary scale glabrous ..... ***R. inamoenus***
18' Sepals 5–8 mm long, 3–7 mm wide; leaf base cordate to broadly obtuse; nectary scale usually ciliate ..... ***R. cardiophyllus***

19. Flowering stems 0.6–3.5 cm long (sometimes longer in fruit); petals 1.2–3.5 mm long ..... ***R. pygmaeus***
19' Flowering stems 4–27 cm long; petals 6–16 mm long ..... ***R. eschscholtzii***

Ranunculus abortivus L. (abortive or incomplete) Littleleaf buttercup. Roots never tuberous, sometimes enlarged basally. **STEMS** erect or suberect, 10–60 cm long, glabrous, never rooting nodally. **LEAVES** with basal blades reniform or circular, 1.4–4.2 cm long, 2–5.2 cm wide, crenulate to crenate-lobulate or sometimes the innermost 3-parted or -foliate, bases shallowly to deeply cordate, apices rounded to rounded-obtuse; upper cauline leaves lobed. **INFL** with pedicels glabrous or nearly so. **FLOWER** sepals spreading or reflexed from base, 2.5–4 mm long, 1–2 mm wide, glabrous; petals 5, yellow, 1.5–3.5 mm long, 1–2 mm wide, nectary scale attached on 3 sides, forming a pocket enclosing the nectary (sometimes with apex free, forming a flap shorter than the pocket), glabrous; style present. **FRUIT** an ovoid head of achenes, 3–6 mm long, 2.5–5 mm wide; achene body thick-lenticular to compressed-globose, 1.4–1.6 mm long, 1–1.5 mm wide, not or weakly flattened, achene wall thick, firm, smooth, glabrous, margin a low, narrow ridge, often inconspicuous, beak subulate, curved, 0.1–0.2 mm long; receptacle sparsely to very sparsely pilose. $2n = 16$. [*R. abortivus* subsp. *acrolasius* (Fernald) B. M. Kapoor & Á. Löve; *R. abortivus* var. *acrolasius* Fernald]. Woods,

meadows, and clearings. COLO: Min. 2550 m (8400'). Flowering: Jun. Across temperate and subarctic North America south to Colorado.

Ranunculus alismifolius Geyer ex Benth. (with leaves like *Alisma*) Caltha-flowered buttercup, plantainleaf buttercup. Roots ± fusiform-thickened proximally. **STEMS** erect or ascending, 15–40 cm long, glabrous, never rooting nodally. **LEAVES** with lower cauline blades lanceolate to narrowly ovate or elliptic, 2.4–9.7 cm long, 0.9–2.2 (–3) cm wide, undivided, bases acute to rounded-obtuse, margins entire (rarely serrulate), apices obtuse to acuminate; bracts lanceolate; upper cauline leaves undivided. **INFL** with pedicels glabrous to appressed-hairy. **FLOWER** sepals spreading or reflexed from base, 2–6 mm long, 1–4 mm wide, glabrous or hirsute; petals 5–12, yellow, 5–9 mm long, (1.5–) 2–3.8 mm wide, nectary scale attached on 3 sides, forming a pocket enclosing the nectary (sometimes with apex free, forming a flap shorter than the pocket), glabrous; style present. **FRUIT** a hemispherical to globose head of achenes, heads 3–7 mm long, 4–8 mm wide; achene body globose-lenticular to globose, 1.6–2.8 mm long, 1.2–2 mm wide, not or weakly flattened, achene wall thick, firm, smooth, glabrous, margin a low, narrow ridge, often inconspicuous, beak lance-subulate, straight or weakly curved (stigma curled up at the tip), 0.4–1.2 mm long; receptacle glabrous. $2n = 16$. Wet meadows, stream banks, and pond margins; ponderosa pine or aspen to spruce-fir and alpine tundra. ARIZ: Apa. COLO: Arc, Con, LPl, Hin, Min, Mon, RGr, SJn; NMEX: SJn; UTAH. 2500–3950 m (8000–13000'). Flowering: May–Sep. New Mexico and Utah, north to Idaho. Ours are **var. *montanus*** S. Watson.

Ranunculus aquatilis L. (living in water) Roots never tuberous. **STEMS** creeping or floating, length indeterminate, glabrous, rooting nodally. **LEAVES**: basal leaves none; cauline leaf blades simple and laminate (with blade distinctly flattened) or completely dissected into filiform segments, or both present with floating laminate leaves and submerged filiform-dissected leaves; laminate leaves reniform, 3-parted, segments obovate or fan-shaped, shallowly cleft, margins crenate. **INFL** with pedicels glabrous. **FLOWER** sepals spreading or reflexed, 2–4 mm long, 1–2 mm wide, glabrous; petals 5, white or white with yellow claws, 4–7 mm long, 1–5 mm wide, nectary scale attached on 3 sides, forming a ridge or shallow pocket not covering the nectary, glabrous; style present. **FRUIT** a hemispherical to ovoid head of achenes, 2–4 mm long, 2–5 mm wide; achene body ellipsoidal or flattened-ellipsoidal, 1–2 mm long, 0.8–1.4 mm wide, not or weakly flattened, achene wall thick, firm, with coarse, transverse ridges, glabrous or hispid, margin a low, narrow ridge, beak filiform, 0.1–1.2 mm long; receptacle hispid. $2n = 16, 32, 48$. Aquatic or on drying mud, streams, irrigation ditches, lakes, and ponds in meadows, riparian woodland, juniper, oak savanna, ponderosa pine, spruce. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Hin, Min, Mon, SMg, SJn; NMEX: McK, RAr, San, SIn; UTAH. 1750–2950 m (5700–9600'). Flowering: May–Sep. Throughout nearly all of North America; almost worldwide. We have two varieties. Unfortunately, deep-water plants may flower without producing any floating leaves. Before such plants can be identified, they must be cultured in shallower water until floating leaves develop. Herbarium specimens with all the leaves filiform-dissected are not identifiable to variety because there is no way to know if the upper leaves were floating or submerged when the plant was alive. Plants with floating leaves laminate and submerged leaves filiform-dissected are **var. *aquatilis*** [*R. aquatilis* var. *hispidulus* Drew; *R. trichophyllus* (Chaix) Bosch var. *hispidulus* (Drew) W. B. Drew]. Those with all leaves (floating and submerged) filiform-dissected are **var. *diffusus*** With. [*Batrachium circinatum* (Sibth.) Spach subsp. *subrigidum* (W. B. Drew) Á. Löve & D. Löve; *B. longirostris* (Godr.) F. W. Schultz; *B. trichophyllum* (Chaix) Bosch; *R. aquatilis* var. *capillaceus* (Thuill.) DC.; *R. aquatilis* var. *longirostris* (Godr.) F. W. Schultz; *B. trichophyllum* (Chaix) Bosch; *R. aquatilis* var. *subrigidus* (W. B. Drew) Breitung; *R. circinatus* Sibth. var. *subrigidus* (W. B. Drew) L. D. Benson; *R. subrigidus* W. B. Drew; *R. trichophyllus* (Chaix) Bosch].

Ranunculus cardiophyllus Hook. (heart-shaped leaves) Heartleaf buttercup. Roots never tuberous. **STEMS** erect, 11–53 cm long, pilose or glabrous, never rooting nodally. **LEAVES** with basal blades ovate or elliptic, 2.2–6.9 cm long, 1.8–4.5 cm wide, crenate but undivided or the innermost 3–5-parted, bases cordate to broadly obtuse, apices rounded to broadly acute; upper cauline leaves lobed. **INFL** with pilose pedicels. **FLOWER** sepals spreading or reflexed from base, 5–8 mm long, 3–7 mm wide, pilose; petals 5–10, yellow, 6–13 mm long, 4–13 mm wide, nectary scale attached on 3 sides, forming a pocket enclosing the nectary (sometimes with apex free, forming a flap shorter than the pocket), ciliate or sometimes glabrous; style present. **FRUIT** an ovoid or cylindrical head of achenes, 5–16 mm long, 5–9 mm wide; achene body thick-lenticular to compressed-globose, 1.8–2.2 mm long, 1.5–2 mm wide, not or weakly flattened, achene wall thick, firm, smooth, margin a low, narrow ridge, often inconspicuous, beak subulate, curved or straight, 0.6–1.2 mm long; receptacle canescent. $2n = 32$. [*R. cardiophyllus* var. *coloradensis* L. D. Benson; *R. cardiophyllus* var. *subsagittatus* (A. Gray) L. D. Benson; *R. pedatifidus* Sm. var. *cardiophyllus* (Hook.) Britton]. Wet meadows and moist slopes of open parks, and subalpine. ARIZ: Apa; COLO: Hin, Min, SJn; NMEX: RAr, SJn. 2350–3500 m (8000–11500'). Flowering: May–Jul. Arizona and New Mexico, north to the Northwest Territories. *Ranunculus cardiophyllus* is very variable

Throughout most of its range, the leaves always have rounded marginal crenae and cordate or truncate bases, the stems are often densely pilose (but may sometimes be sparsely pilose or glabrous), and the achene beaks are curved. However, in plants from Arizona and New Mexico the leaves sometimes have obtuse marginal crenae or broadly obtuse bases, the stems are never densely pilose, and the achene beaks are sometimes straight. Forms showing some or all of these characters are often separated as *R. cardiophyllus* var. *subsagittatus*, but the characters are poorly correlated and taxonomic recognition is not warranted.

Ranunculus cymbalaria Pursh (cymbal-like) Marsh buttercup, alkali buttercup. Roots never tuberous. **STEMS** dimorphic, flowering stems erect or ascending, stolons prostrate, 9–41 cm long, glabrous or sparsely hirsute, rooting nodally. **LEAVES** with basal blades oblong to cordate or circular, 0.5–3.8 cm long, 0.6–3.8 cm wide, simple and undivided, bases rounded to cordate, margins crenate or crenate-serrate (sometimes weakly so, rarely nearly entire), apices rounded; upper cauline leaves small and undivided. **INFL** with pedicels glabrous to sparsely pilose. **FLOWER** sepals spreading, 2.5–6 mm long, 1.5–3 mm wide, glabrous (rarely sparsely hirsute); petals 5–7 (–8), yellow, 2–7 mm long, 1–3 mm wide, nectary scale attached basally, forming a flap over the nectary, glabrous; style present. **FRUIT** a long-ovoid or cylindrical head of achenes, 6–12 mm long, 4–5 (–9) mm wide; achene body discoid to flattened-lenticular, oblong to obovate in outline, 1.4 (–2.2) mm long, 0.8–1.2 mm wide, moderately flattened, achene wall papery, longitudinally nerved, glabrous, margin a prominent narrow ridge, beak conical, straight, 0.1–0.2 mm long; receptacle hispid or glabrous. $2n = 16$. [*Halerpestes cymbalaria* (Pursh) Greene; *Ranunculus cymbalaria* var. *alpina* Hook.; *R. cymbalaria* var. *saximontanus* Fernald]. Marshes, ditches, muddy areas, often saline; hanging gardens, seeps, marshes, streams, and ponds. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, SJn; UTAH. 1350–2700 m (4400–8900′). Flowering: May–Sep. Circumboreal, south to South America. *Ranunculus cymbalaria* is very different from our other *Ranunculus* species, especially in the thin, papery walls of its achenes, which split open along the adaxial margin like a follicle when squeezed end-to-end. It has often been treated as a separate small genus, *Halerpestes*, but recent research suggests that it is actually very closely related to the genus *Trautvetteria* (Johansson 1998), which also has a papery, strongly veined fruit wall (fruit considered a utricle). Further research is needed before the genera can be redefined in a more natural way.

Ranunculus eschscholtzii Schltdl. (for Johann F. Gustav von Eschscholtz, 1793–1831, an Estonian surgeon and botanist) Eschscholtz's buttercup. Roots never tuberous. **STEMS** erect or decumbent from prominent caudices, 4–27 cm long, glabrous, never rooting nodally. **LEAVES** with basal blades reniform or cordate, 1–2.3 cm long, 1.5–3.7 cm wide, 3-parted with at least the lateral segments again lobed, bases truncate or cordate, apices rounded in outline; upper cauline leaves lobed. **INFL** with glabrous pedicels. **FLOWER** sepals spreading or reflexed from base, 4–8 mm long, 2–6 mm wide, glabrous or pilose; petals 5–8, yellow, 6–12 mm long, 4–16 mm wide, nectary scale attached on 3 sides, forming a pocket enclosing the nectary (sometimes with apex free, forming a flap shorter than the pocket), glabrous; style present. **FRUIT** a cylindrical or ovoid head of achenes, 5–10 mm long, 4–7 mm wide; achene body thick-lenticular to compressed-globose, 1.4–2 mm long, 1–1.6 mm wide, not or weakly flattened, achene wall thick, firm, smooth, glabrous, margin a low, narrow ridge, often inconspicuous, beak lanceolate or subulate, straight (sometimes curved when immature), 0.6–1.8 mm long; receptacle glabrous or sparsely pilose. $2n = 32, 48$. Riparian meadows, open rocky slopes, spruce, timberline, snowmelt area; high subalpine. COLO: Hin, LPl, Mon, SJn. 3300–3600 m (10800–11800′). Flowering: Jul. New Mexico west to California, north to Alaska. Our plants are **var. *eschscholtzii.***

Ranunculus flammula L. (a little flame) Greater creeping spearwort. Roots not thickened. **STEMS** erect to prostrate or sometimes ascending, 5–30 cm long, glabrous or sparsely strigose, usually rooting nodally. **LEAVES** with lower cauline blades lance-elliptic to lanceolate or linear, 0.8–3.3 cm long, 0.1–0.9 cm wide, undivided, bases acute to filiform, margins entire or serrulate, apices acute to filiform; bracts lanceolate to oblanceolate; upper cauline leaves undivided. **FLOWER** sepals spreading or weakly reflexed, 2–3 mm long, 1–2 mm wide, glabrous or appressed-hispid; petals 5–6, yellow, 3–5 mm long, 2–3 mm wide, nectary scale attached on 3 sides, forming a pocket enclosing the nectary (sometimes with apex free, forming a flap shorter than the pocket), glabrous; style present. **FRUIT** a globose or hemispherical head of achenes, 2–4 mm long, 3–4 mm wide; achene body globose-lenticular to globose, 1.2–1.6 mm long, 1–1.4 mm wide, not or weakly flattened, achene wall thick, firm, smooth, glabrous, margin a low, narrow ridge, often inconspicuous, beak lanceolate to linear, straight or curved, 0.1–0.6 mm long; receptacle glabrous. $2n = 32$. [*R. reptans* L. var. *ovalis* (J. M. Bigelow) Torr. & A. Gray]. Muddy ground or shallow water at margins of ponds, lakes, and streams in meadows, ponderosa pine, Douglas-fir, and spruce. ARIZ: Apa; COLO: Hin; NMEX: McK, SJn. 2500–3350 m (8100–11000′). Flowering: Jun–Sep. Across cool-temperate and subarctic North America, south to California, Arizona, New Mexico, and Pennsylvania. Our plants are **var. *ovalis*** (J. M. Bigelow) L. D. Benson (oval), which, as currently under-

stood, is heterogeneous across its range, but material from the study area is relatively uniform. Biosystematic study of *R. flammula* as a whole, concentrating on more northern areas, will be needed before the nomenclature of our plants is really stable.

Ranunculus glaberrimus Hook. (most glabrous) Sagebrush buttercup. Roots thick but not tuberous. **STEMS** prostrate or ascending, 4–15 cm long, glabrous, never rooting nodally. **LEAVES** with basal blades elliptic to oblong or reniform, 0.7–1.9 cm long, 1–1.7 cm wide, entire to deeply 3-crenate, bases obtuse to truncate, apices rounded; upper cauline leaves deeply 3-crenate to unlobed. **INFL** with pedicels glabrous or nearly so. **FLOWER** sepals spreading or reflexed from base, 5–8 mm long, 3–7 mm wide, glabrous or sparsely pilose; petals 5–10, yellow, 8–13 mm long, 5–12 mm wide; nectary scale attached on 3 sides, forming a pocket enclosing the nectary (sometimes with apex free, forming a flap shorter than the pocket), glabrous or ciliate; style present. **FRUIT** a globose head of achenes, 7–12 (–20) mm long, 6–11 (–20) mm wide; achene body thick-lenticular to compressed-globose, 1.4–2.2 mm long, 1.1–1.8 mm wide, not or weakly flattened; achene wall thick, firm, smooth, usually finely pubescent; margin a low, narrow ridge, often inconspicuous; beak subulate or lance-subulate, straight or curved, 0.4–1 mm long; receptacle glabrous. $2n = 80$. [*R. ellipticus* Greene; *R. oreogenes* Greene]. Moist, seepy slopes, dry meadows, Gambel's oak–ponderosa pine. ARIZ: Apa; COLO: Arc, Dol, Mon, SMg. 2300–2700 m (7500–8800'). Flowering: Apr–May. Arizona and New Mexico north to Alberta. Ours are **var. *ellipticus*** (Greene) Greene (elliptic).

Ranunculus gmelinii DC. (for Johann Georg Gmelin, 1709–1755, a German naturalist) Gmelin's buttercup. Roots never tuberous. **STEMS** reclining or sometimes floating, 2–60 cm long, glabrous or hirsute, rooting nodally. **LEAVES**: basal leaves none; cauline leaf blades reniform to circular, 0.6–6.5 cm long, 1.1–9 cm wide, blade 3-parted, segments again 1–3 times lobed to dissected, entire or crenate, bases cordate, apices rounded to filiform. **INFL** with glabrous pedicels. **FLOWER** sepals spreading or reflexed from base, 2–5 mm long, 2–4 mm wide, glabrous or sparsely pilose; petals 4–14, yellow, 3–7 mm long, 2–5 mm wide, nectary scale well developed and attached basally, forming a flap with nectary displaced on its outer surface, glabrous; style present. **FRUIT** a globose or ovoid head of achenes, 3–7 mm long, 2–5 mm wide; achene body thick-lenticular or compressed-ellipsoidal to discoid, 1–1.6 mm long, 1–1.2 mm wide, not or weakly flattened; achene wall thick, firm, smooth, glabrous, margin a broad, low or high corky band or ridge; beak narrowly lanceolate or filiform, 0.4–0.8 mm long; receptacle sparsely hispid. $2n = 16, 32, 64$. [*R. gmelinii* subsp. *purshii* (Richardson) Hultén; *R. gmelinii* var. *hookeri* (D. Don) L. D. Benson; *R. gmelinii* var. *limosus* (Nutt.) H. Hara; *R. gmelinii* var. *prolificus* (Fernald) H. Hara; *R. purshii* Richardson]. Shallow water or drying mud, meadows and margins of ponds and lakes in oak–ponderosa pine to spruce or spruce-fir. ARIZ: Apa; COLO: Arc; NMEX: Sln. 2300–2750 m (7500–9000'). Flowering: Jun–Sep. Circumboreal, south to Nevada, Utah, New Mexico, Wisconsin.

Ranunculus hyperboreus Rottb. (extreme northern) High northern buttercup. Roots never tuberous. **STEMS** prostrate or floating, length indeterminate, glabrous, rooting nodally. **LEAVES**: basal leaves none; cauline leaf blades wider than long, 0.3–1.2 cm long, 0.4–2.1 cm wide, deeply 3-lobed or 3-parted, sometimes with a shallow tooth on each lateral lobe, bases cordate to broadly rounded, apices rounded. **INFL** with glabrous pedicels. **FLOWER** sepals spreading or slightly reflexed from base, 2–4 mm long, 1–3 mm wide, glabrous; petals 5, yellow, 2–4 mm long, 1–3 mm wide; nectary on petal surface, scale poorly developed and forming a crescent-shaped ridge surrounding the nectary; style 0.1–0.2 mm. **FRUIT** a ± spheric head of achenes, 3–5 mm long, 2–5 mm wide; achene body compressed-ellipsoid, 1–1.5 mm long, 0.8–1.2 mm wide, not or weakly flattened; achene wall thick, firm, smooth, glabrous; margin a low, poorly developed ridge; beak minute, hooked, 0.1–0.4 mm long; receptacle glabrous. [*R. natans* C. A. Mey. var. *intertextus* (Greene) L. D. Benson]. Subalpine ponds, peat bogs, and spruce-fir communities. COLO: Sln. 2950–3050 m (9600–10100'). Flowering: Jun–Jul. Circumboreal, south to Nevada, Utah, Colorado, Newfoundland.

Ranunculus inamoenus Greene (unlovely) Graceful buttercup, unlovely buttercup. Roots never tuberous. **STEMS** erect, 5–33 cm long, pilose or glabrous, never rooting nodally. **LEAVES** with basal blades ovate, obovate, or orbicular (rarely reniform), 1–3.7 cm long, 1.1–3.5 cm wide, crenate and undivided or the innermost with 2 clefts or partings near apex; bases acute to rounded, apices rounded; upper cauline leaves lobed. **INFL** with appressed-pubescent pedicels. **FLOWER** sepals spreading or reflexed from base, 3–5 mm long, 2–3 mm wide, pilose; petals 5, yellow, 4–9 mm long; 2–5 mm wide; nectary scale attached on 3 sides, forming a pocket enclosing the nectary (sometimes with apex free, forming a flap shorter than the pocket), glabrous; style present. **FRUIT** a cylindrical head of achenes, 7–17 mm long, 5–8 mm wide; achene body thick-lenticular to compressed-globose, 1.5–2 mm long, 1.3–1.8 mm wide, not or weakly flattened; achene wall thick, firm, smooth, glabrous, margin a low, narrow ridge, often inconspicuous; beak subulate, straight or hooked, 0.4–0.9 mm long; receptacle pilose or glabrous. $2n = 32, 48$. [*R. inamoenus* var. *alpeophilus* (A. Nelson)

L. D. Benson]. Meadows, margins of streams, ponds, and lakes; slopes, occasionally aspen, Gambel's oak, ponderosa pine, Douglas-fir, and spruce-fir communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: RAr, SJn; UTAH. 2250–3750 m (7400–12300'). Flowering: Apr–Sep. North to Alberta, east to Nebraska. Our plants are **var. *inamoenus.***

Ranunculus macauleyi A. Gray (for Charles Adam Hoke McCauley, 1843–1913, soldier and naturalist) Rocky Mountain buttercup. Roots never tuberous. **STEMS** erect from short caudices, 4–15 cm long, glabrous or sometimes pilose, never rooting nodally. **LEAVES** with basal blades narrowly elliptic to lanceolate or oblanceolate, 1.5–4.5 cm long, 0.5–1.1 (–2.8) cm wide, undivided and entire except for apex, bases acute or long-attenuate, apices truncate or rounded and 3 (–5)-toothed; upper cauline leaves simple or apically lobed. **INFL** with pedicels glabrous or brown (or white)-pilose. **FLOWER** sepals spreading or reflexed from base, 6–12 mm long, 2.5–8 mm wide, densely brown-pilose; petals 5 (–8), yellow, 10–19 mm long, 6–21 mm wide, nectary scale attached on 3 sides, forming a pocket enclosing the nectary (sometimes with apex free, forming a flap shorter than the pocket), glabrous; style present. **FRUIT** an ovoid or cylindrical head of achenes, 5–10 mm long, 4–5.5 mm wide; achene body thick-lenticular to compressed-globose, 1.5–1.7 mm long, 1.2–1.3 mm wide, not or weakly flattened, achene wall thick, firm, smooth, glabrous, margin a low, narrow ridge, often inconspicuous, beak slender, straight or recurved, 0.5–1.5 (–2.2) mm long; receptacle glabrous. Sunny, open soil of alpine meadows and slopes. COLO: Arc, Con, Hin, LPl, Min, Mon, SJn. 3600–3950 m (11800–13000'). Flowering: Jun–Aug. Colorado, New Mexico; east to the west slope of the Rockies. Two aberrant specimens (*M. Heil 22*, *L. Herring 88*) have 7–11 teeth 1–3 mm long in the distal half of the basal and cauline leaves.

Ranunculus macounii Britton (for James M. Macoun, 1862–1920, Canadian botanist and ornithologist) Macoun's buttercup. Roots never tuberous. **STEMS** prostrate to erect, 13–38 cm long, hirsute or glabrous, often rooting nodally. **LEAVES** with basal blades cordate to reniform in outline, 3.7–7.5 cm long, 4.5–9.5 cm wide, 3-foliolate, leaflets 3-lobed or -parted, ultimate segments elliptic or lance-elliptic, toothed or lobulate, apices acute to broadly acute; upper cauline leaves deeply parted or compound. **INFL** with hirsute pedicels. **FLOWER** sepals spreading or reflexed about 1 mm above base, 4–6 mm long, 1.5–3 mm wide, glabrous or hirsute; petals 5, yellow, 4–6 (–7.5) mm long, 3.5–5 mm wide, nectary scale attached basally, forming a flap covering the nectary, glabrous; style present. **FRUIT** a globose or ovoid head of achenes, 7–11 mm long, 7–10 mm wide; achene body discoid, 2.4–3 mm long, 2–2.4 mm wide, much thinner than broad, achene wall thick, firm, smooth, glabrous, margin a narrow rib, beak lanceolate to broadly lanceolate, straight or nearly so, 1–1.2 mm long; receptacle hirsute. $2n = 32, 48$. Wet soil or emergent from shallow water, meadows, ditches, seeps, edges of ponds and streams in cottonwood, willow, Gambel's oak, ponderosa pine, Douglas-fir, and spruce-fir communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Mon; NMEX: McK, RAr, SJn. 1700–2700 m (5600–8900'). Flowering: May–Jul (–Sep). North to Alaska, east to Newfoundland.

Ranunculus pensylvanicus L. f. (of Pennsylvania) Pennsylvania buttercup. Roots never tuberous. **STEMS** erect, 45 cm long, hispid, never rooting nodally. **LEAVES** with basal blades broadly cordate in outline, 1.6–7 cm long, 3–9 cm wide, 3-foliolate, leaflets cleft (usually deeply so), ultimate segments narrowly elliptic, toothed, apices acute; upper cauline leaves deeply parted or compound. **INFL** hirsute pedicels. **FLOWER** sepals reflexed about 1 mm above base, 3–5 mm long, 1.5–2 mm wide, ± hispid; petals 5, yellow, 2–3 mm long, 1–2.5 mm wide, nectary scale attached basally, forming a flap covering the nectary, glabrous; style present. **FRUIT** a cylindrical head of achenes, 9–12 mm long, 5–7 mm wide; achene body discoid, 1.8–2.8 mm long, 1.6–2 mm wide, much thinner than broad, achene wall thick, firm, smooth, glabrous, margin a narrow rib, beak broadly lanceolate or subdeltoid, straight or nearly so, 0.6–0.8 mm long; receptacle hirsute. $2n = 16$. Riparian. COLO: Arc, LPl, SJn. 1850–2700 m (6100–8900'). Flowering: Jul. North to Alaska, east to Newfoundland.

Ranunculus pygmaeus Wahlenb. (dwarf) Pygmy buttercup. Roots never tuberous. **STEMS** erect or ascending from short caudices, 0.6–3.5 cm long, glabrous or sparsely pilose, never rooting nodally. **LEAVES** with basal blades reniform to transversely elliptic or semicircular, 0.45–0.9 cm long, 0.6–1.3 cm wide, 3-parted or -divided, at least lateral segments again lobed, bases truncate or subcordate, apices rounded to obtuse; upper cauline leaves lobed. **INFL** with glabrous or pubescent pedicels. **FLOWER** sepals spreading or reflexed from base, 2–4 mm long, 1.2–1.6 mm wide, sparsely hairy; petals 5, yellow, 1.2–3.5 mm long, 1.1–2.8 mm wide, nectary scale attached on 3 sides, forming a pocket enclosing the nectary (sometimes with apex free, forming a flap shorter than the pocket), glabrous; style present. **FRUIT** a subglobose to cylindrical head of achenes, 2.5–7 mm long, 2.5–5 mm wide; achene body thick-lenticular to compressed-globose, 1–1.2 mm long, 0.8–1.1 mm wide, not or weakly flattened, achene wall thick, firm, smooth, glabrous, margin a low, narrow ridge, often inconspicuous, beak subulate, straight or curved, 0.3–0.7 mm long; receptacle glabrous. $2n = 16$. [*R. pygmaeus* var. *langianus* Nathorst]. Snowmelt areas; alpine meadows and slopes. COLO: SJn.

4250 m (13900'). Flowering: Aug. North to Alaska, east to Greenland and Spitzbergen. Inconspicuous; the San Juan County site is one of two known from the West Slope of the Colorado Rockies, the other is outside our area.

Ranunculus repens L. (creeping) Creeping buttercup. Roots never tuberous. **STEMS** decumbent or creeping, 25 cm long, hispid to strigose or almost glabrous, rooting nodally. **LEAVES** with basal blades ovate to reniform in outline, 1–8.5 cm long, 1.5–10 cm wide, 3-foliolate, leaflets lobed, parted, or parted and again lobed, ultimate segments obovate to elliptic or sometimes narrowly oblong, toothed, apices obtuse to acuminate; upper cauline leaves deeply parted or compound. **INFL** with appressed-hairy pedicels. **FLOWER** sepals spreading or reflexed from base, 4–7 (–10) mm long, 1.5–3 (–4) mm wide, hispid or sometimes glabrous; petals 5 (–15), yellow, 6–18 mm long, 5–12 mm wide; nectary scale attached basally, forming a flap covering the nectary, glabrous; style present. **FRUIT** a globose or ovoid head of achenes, 5–10 mm long, 5–8 mm wide; achene body discoid, 2.6–3.2 mm long, 2–2.8 mm wide, much thinner than broad; achene wall thick, firm, smooth, glabrous, margin a narrow rib; beak lanceolate to lance-filiform, curved, 0.8–1.2 mm long; receptacle hispid or rarely glabrous. $2n = 14, 32$. [*R. repens* var. *erectus* DC., *R. repens* var. *glabratus* DC.; *R. repens* var. *linearilobus* DC.; *R. repens* var. *pleniflorus* Fernald; *R. repens* var. *villosus* Lamotte] Meadows, borders of marshes, pastures, streams in shaded ravines. COLO: Arc, Mon, 1850–2300 m (6100–7600'). Flowering: Jun–Jul. Native to Eurasia, naturalized in temperate areas worldwide. Plants with sparse pubescence have been called *R. repens* var. *glabratus*. Horticultural forms with the outer stamens transformed into numerous extra petals occasionally become established and have been called *R. repens* var. *pleniflorus*. These variants have no taxonomic significance.

Ranunculus sceleratus L. (hard) Blister buttercup. Roots never tuberous. **STEMS** erect, 8–32 cm long, glabrous, only very rarely rooting at lower nodes. **LEAVES** with basal and lower cauline blades reniform to semicircular in outline, 1–5 cm long, 1.6–6.8 cm wide, 3-lobed or -parted (sometimes deeply so), segments again lobed or parted, sometimes undivided, crenate or lobulate, bases truncate to cordate, apices rounded or occasionally obtuse; upper cauline leaves deeply 3-parted or compound. **INFL** with glabrous pedicels. **FLOWER** sepals reflexed from at or near the base, 2–5 mm long, 1–3 mm wide, glabrous or sparsely hirsute; petals 3–5, yellow, 2–5 mm long, 1–3 mm wide; nectary scale poorly developed and forming a crescent-shaped or circular ridge surrounding but not covering the nectary, glabrous; style none. **FRUIT** an ellipsoidal or cylindrical head of achenes, 3–9 mm long, 3–5 mm wide; achene body thick-lenticular or compressed-ellipsoidal to discoid, 1–1.2 mm long, 0.8–1 mm wide, not or weakly flattened; achene wall thick, firm, smooth or finely transversely wrinkled, glabrous; margin a broad, low or high corky band or ridge; beak triangular, usually straight, 0.1 mm long; receptacle pubescent or glabrous. [*Hecatonia scelerata* (L.) Fourr.] Semiaquatic, wet ground or shallow water, in bogs, ponds, shores of lakes and rivers. ARIZ: Apa; COLO: Arc, LPl, NMEX: McK, RAr, SJn; UTAH. 1100–2350 m (3600–8000'). Flowering: May–Sep. North to Alaska, east to Quebec. Two weak varieties in the study area: **var**. ***sceleratus*** with fruits smooth (longitudinal striations visible only at high magnification), and **var** ***multifidus*** Nutt. (multiply divided) with achenes finely transversely wrinkled (visible at 10×).

Ranunculus uncinatus D. Don (hooked) Woodland buttercup. Roots never tuberous. **STEMS** erect, hispid or glabrous, never rooting nodally. **LEAVES** with basal blades cordate to reniform in outline, 1.8–5.6 cm long, 2.8–8.3 cm wide, 3-parted or sometimes 3-foliolate, segments again lobed, ultimate segments elliptic to lanceolate, toothed or crenate-toothed, apices acute to rounded-obtuse; upper cauline leaves deeply parted or compound. **INFL** with appressed-pubescent pedicels. **FLOWER** sepals reflexed or sometimes spreading, 2–4.5 mm long, 1–2 mm wide, pubescent; petals 5, yellow, 2–5 mm long, 1–2 (–3) mm wide; nectary scale attached basally or on 3 sides, forming a flap or pocket covering the nectary, glabrous; style present. **FRUIT** a globose or hemispherical head of achenes, 4–7 mm long, 4–8 mm wide; achene body discoid, 2–3 mm long, 1.6–2 mm wide, much thinner than broad; achene wall thick, firm, smooth, glabrous; margin a narrow rib; beak lanceolate, curved and hooked, 1–2.5 mm long; receptacle glabrous. $2n = 28$. [*R. bongardii* Greene; *R. bongardii* var. *tenellus* (A. Gray) Greene; *R. uncinatus* var. *earlei* (Greene) L. D. Benson; *R. uncinatus* var. *parviflorus* (Torr.) L. D. Benson]. Moist riparian, meadows, seeps, and wet depressions in woodlands of aspen-fir or spruce-fir communities. COLO: Mon, SJn; UTAH. 2150–2900 m (7000–9500'). Flowering: Jun–Jul. Arizona, New Mexico, north to Alaska, west to southern California. Plants with hispid stems and achenes are often separated as *R. uncinatus* var. *parviflorus*, but these two characters are poorly correlated and sometimes vary between plants in a single collection.

Thalictrum L. Meadow-rue

(*Thaliktron*, an ancient name used by Dioscorides) Perennial herbs with woody rhizomes, caudices, or tuberous roots. **STEMS** erect or ascending, usually branched in large species, unbranched in *T. alpinum*. **LEAVES** basal and cauline, alternate; blade ovate to reniform in outline, 1–4 times ternately or pinnately compound; leaflets cordate-reniform, obovate, lanceolate, or linear, margins often 3–5+-lobed, crenate or entire. **INFL** a terminal, sometimes also axillary,

(1–) 2–200-flowered panicle, raceme, corymb, or umbel, to 41 cm long, or flower solitary; involucres absent or involucral bracts 2–3 (these compound, when sessile resembling a whorl of 6–9 simple bracts), leaflike, not closely subtending flowers. **FLOWERS** actinomorphic, all bisexual, bisexual and unisexual on same plant, or all unisexual on monoecious or dioecious plants; sepals 4–10, whitish to greenish yellow or purplish, planar, lanceolate to reniform or spatulate, 1–18 mm long; petals absent; stamens 7–30, filaments filiform to clavate or distally dilated; staminodes absent between stamens and pistils; pistils 1–16, each with 1 ovule; style elongate with decurrent style, or absent. **FRUIT** sessile or stipitate, ovoid to obovoid, falcate, or discoid aggregate achenes, fruit walls prominently veined or ribbed; beak straight to coiled or absent, 0–4 mm long. $x = 7$. One hundred twenty to 200 species, mostly temperate, nearly worldwide. Several species are cultivated as ornamentals. Approaching our area, or reported from it, are *T. dasycarpum* Fisch. & Avé-Lall. (leaflet with the length up to 3 times the width, acutely 0–3 (–5)-lobed, lobes entire, margins revolute; hairs multicellular, nonglandular, rare glands minute and sessile), *T. occidentale* A. Gray (fruits all deflexed against pedicel), *T. revolutum* DC. (leaflet shape and margins as in *T. dasycarpum*, but all hairs gland-tipped and unicellular), *T. sparsiflorum* Turcz. ex Fisch. & C. A. Mey. (flowers bisexual, stigmatic beak of achene 1–1.5 mm long, anther blunt-tipped, shorter than filament), and *T. venulosum* Trel. (achenes terete or subterete, also smaller—3–4 (–6) mm—and narrower than in *T. fendleri*). Although *T. alpinum* is distinctive, most other western North American species are more similar, variable, and taxonomically confusing. From this group a single species, *T. fendleri*, from San Juan drainage material, has been identified. Future collections should include both male and female plants (with mature fruits) taken on the same day from the same population, and whole plants (not merely a piece of the panicle).

1. Plants scapose or with a single cauline leaf; inflorescence racemose; flowers bisexual ..... ***T. alpinum***
1′ Plants with leafy stems; inflorescence paniculate; flowers unisexual (very rarely also bisexual) ..... ***T. fendleri***

Thalictrum alpinum L. (alpine) Arctic meadow-rue, dwarf meadow-rue. **STEMS** erect, scapose or nearly so, 6–20 (–30) cm tall, with very slender rhizomes. **LEAVES** all basal or a single cauline leaf near the base, leaf blade twice ternately or twice pinnately compound with proximal primary divisions ternate; leaflets 2–10 mm long, obovate to orbiculate, apically 3–5-lobed, the lobes often again lobed. **INFL** an elongate raceme, few-flowered. **FLOWERS** bisexual, sepals 5, ovate or elliptic; anthers acute or apiculate; filaments filiform. **FRUITS** 2–6 per flower, reflexed or appearing so because of a sharp bend near pedicel apex; body of achene lance-obovoid, 2–3.5 mm, thick-veined, 2–3-ribbed, stigmatic beak about 0.7 mm. $2n = 14$ (all from Asia or Greenland), 21. Wet meadows, damp, rocky ledges and slopes, and cold (often calcareous) bogs in willow-sedge, lodgepole pine, and spruce-fir, outcrops, subalpine and alpine. COLO: Hin, LPl, SJn. 2350–4200 m (7700–13700′). Flowering: Jul. Circumpolar, isolated in alpine zones south to California, Utah, New Mexico.

Thalictrum fendleri Engelm. ex A. Gray (for Augustus Fendler) Fendler's meadow-rue. **STEMS** mostly erect, sometimes reclining, leafy, (20–) 30–60 (–160) cm tall, from rhizomes or branched caudices. **LEAVES** mainly cauline, leaf blade (2–) 3–4-ternately compound, glandular or glabrous; leaflets (5–) 10–20 mm long, obliquely orbiculate, apically 3+-lobed, crenate, margins sometimes slightly revolute but inconsistently so on any specimen. **INFL** a leafy panicle, many-flowered. **FLOWERS** unisexual (plants dioecious), very rarely intermixed with some bisexual flowers, sepals 4 (–6), in pistillate flowers ovate to rhombic or broadly lanceolate (ovate to elliptic in staminate flowers); anthers apiculate, filaments filiform. **FRUITS** 7–11 (–14) per flower, spreading; body of achene oblique (lopsided), oblanceolate to obovate-elliptic, strongly angled and bilaterally compressed, length less than twice the width, 4–6 mm long, 2.5–3 mm wide, conspicuous veins 3–4 (–5) on each side, veins prominently raised forming the angles, converging toward ends (rarely branched or sinuous), not anastomosing-reticulate; stigmatic beak (1.5–) 2.5–4 mm. [*T. fendleri* var. *platycarpum* Trel.; *T. fendleri* var. *wrightii* Trel.] Gambel's oak, chokecherry, ponderosa pine, Douglas-fir, aspen, and spruce-fir communities. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, SJn; UTAH. 1750–3350 m (5700–11000′). Flowering: (May–) Jun–Sep. Fruit: Jul–Sep. Oregon to South Dakota, south to California, Arizona, New Mexico, Texas, and Mexico. Common. An extremely variable species, commonly with minute sessile or stipitate glands especially on leaves and fruits. This species has petiolate, leaflike bracts subtending panicle branches. The panicles of other species often confused with *T. fendleri* have only sessile leaflike bracts, appearing to be three leaves at a node because of their ternate architecture. Native tribes prepared decoctions from the roots to cure colds and gonorrhea.

Trautvetteria Fisch. & C. A. Mey. False Bugbane, Tassel-rue

(for Ernst Rudolph von Trautvetter, Russian botanist) Perennial herbs with short, slender rhizomes. **STEMS** erect, branched. **LEAVES** basal and cauline, alternate, simple; blades palmately 5–11-lobed; segments broadly cuneate, margins lacerate to serrate or sharply toothed. **INFL** terminal, ± many-flowered corymb, 2.5–43 cm long; bracts

inconspicuous, linear-lanceolate, not forming involucre. **FLOWERS** actinomorphic, bisexual; sepals 3–5 (–7), greenish white, concave-cupped, broadly ovate to obovate, 3–6 mm long; petals and nectaries absent; stamens about 50–100, outer filaments spatulate, often distally wider than anthers, inner filaments not dilated; staminodes absent between stamens and pistils; pistils 15–16, simple; ovule 1 per pistil; style short, hooked. **FRUIT** sessile, ellipsoid to obovoid aggregate utricles, 4-angled in cross section, fruit walls prominently veined, beak terminal, curved to hooked, 0.4–0.8 mm long. $x = 8$. One species, North America, eastern Asia.

Trautvetteria caroliniensis (Walter) Vail (of Carolina) False bugbane, tassel-rue. Plants 0.5–1.5 m tall. Rhizomes with fascicles of fibrous roots. **STEMS** 1–several, erect, usually unbranched below distalmost bract, glabrous or glabrate. **LEAVES** (basal) with petiole 7–45 cm long, blade 8–30 (–40) cm wide, lobes acute to acuminate; cauline leaves reduced toward apex of stem. **INFL** peduncle 10–80 cm long; pedicels sparsely pubescent with minute, curled trichomes. **FLOWER** stamens white, 5–10 mm long. **FRUIT** papery, veins prominent along angles and on 2 adaxial faces. $2n = 16$. [*T. caroliniensis* var. *borealis* (H. Hara) T. Shimizu; *T. caroliniensis* var. *occidentalis* (A. Gray) C. L. Hitchc.; *T. grandis* Nutt.; *T. palmata* Fisch. & C. A. Mey.]. Riparian and other wet areas in montane spruce-fir forests to subalpine and alpine meadows. COLO: Arc, Hin, LPl, SJn; UTAH. 2350–3900 m (8000–12800'). Flowering: Jun–Aug. Distribution disjunct: Pacific Northwest and northern Rocky Mountains (British Columbia and Montana to northwestern Wyoming and California); southern Rocky Mountains (Arizona, New Mexico, and Mexico); southeastern United States (Illinois and Pennsylvania south to Arkansas and Florida); eastern Asia.

Trollius L. Globe-flower

(German *trollblume*, globe-flower) Perennial herbs with short caudices. **STEMS** erect or ascending, unbranched. **LEAVES** basal and cauline, alternate; blade pentagonal to orbicular in outline, deeply palmately divided into (3–)5–7 segments; segments obovate, ± 3-lobed, margins coarsely toothed, often incised. **INFL** terminal, 1–3-flowered (to 7-flowered in Eurasian species), open cyme, 2–30 cm long; bracts leaflike, not forming involucre. **FLOWERS** actinomorphic, bisexual; sepals (4–) 5–9 (–30 in species outside our area), white (to orange-yellow, orange-red, or purplish outside our area), ± planar (strongly concave and incurved outside our area), elliptic, orbiculate, or obovate, 10–30 mm long; petals 5–25, yellow or orange, planar, linear-oblong (ovate outside our area), 2–10 (–40 in other species) mm long; nectary within pocketlike base of blade; stamens 20–75, filaments filiform, staminodes absent between stamens and pistils; pistils 5–28 (–50 outside our area), each with 4–5 (–9) ovules; style attenuate. **FRUIT** sessile, aggregate, oblong follicles, fruit walls transversely veined; beak terminal, straight, 2–4 mm long. $x = 8$. About 30 species. North America, Europe, Asia. Several ornamental species cultivated in North America.

Trollius albiflorus (A. Gray) Rydb. **CP** (white-flowered) White globe-flower. **STEMS** 4–55 cm tall (to 80 cm in fruit), base with few petioles persistent from previous year. **LEAVES**: basal leaves with petioles 4–25 cm long, some leaves reduced to ovate, sessile, membranous scales; cauline leaves 1–3 (–5), with broad, clasping, membranous sheaths. **FLOWERS** 2.5–5 cm diameter; sepals 5–9, spreading, white when fresh (pale yellow to greenish white before anthesis); petals 15–25, yellow, 1/2–2/3 stamen length when pollen is nearly orbiculate to obovate or ovate, 10–20 mm long; stamen length when pollen is shed, 3–6 mm long. **FRUIT** usually 11–14, 8–16 mm long including beak; beak often somewhat recurved, sometimes straight. $2n = 16$. [*T. laxus* Salisb. var. *albiflorus* A. Gray]. Wetlands, along streams, subalpine to alpine meadows. COLO: Arc, Hin, LPl, Min, Mon, SJn. 3000–3850 m (9800–12700'). Flowering: May–Aug. Southwestern Canada south to Washington, Idaho, Utah, and Colorado. Sometimes confused with *Anemone narcissiflora* subsp. *zephyra*, which has sepals yellow (not white), achenes (not follicles), cauline leaves whorled (not alternate), and the stems and leaves pilose to villous (not glabrous).

RHAMNACEAE Juss. BUCKTHORN FAMILY

John R. Spence

Shrubs or small trees. **STEMS** armed or unarmed, typically strongly branched, bark smooth to somewhat shreddy, sometimes furrowed, bud scales present or absent. **LEAVES** deciduous to evergreen, alternate to opposite, solitary or in fascicles, petiolate, simple or rarely compound, pinnately veined or with several distinct veins rising from leaf base, stipules present, small. **INFL** a terminal or axillary cyme or cymose panicle, raceme, or umbel, or sometimes flowers solitary. **FLOWERS** actinomorphic, perigynous or epigynous, perfect or unisexual, 4–5-merous; sepals usually deciduous, triangular, free; petals (0) 4 or 5, free, concave or hoodlike, often clawed at base, showy or inconspicuous; stamens 4–5, opposite the petals, filaments adnate to petals, anthers often enclosed in petal hood, dehiscing longitudinally,

nectary disc well developed, alternate with filaments, adnate to hypanthium, free from ovary to sometimes enveloping entire ovary; ovary of 2–5 carpels, unilocular or plurilocular, ovules solitary, placentation basal, style lobed or deeply cleft. **FRUIT** a capsule or drupe with 1–3 stones enclosing seeds. A family of 60 genera and about 900 species, distributed worldwide, but most common in the tropics. The buckthorn family includes a few species with edible fruits, such as *Ziziphus jujuba*, jujube, from Europe, as well as valuable honey plants. Many species are used medicinally in various parts of the world, and some are commonly cultivated as ornamentals, especially in *Ceanothus*.

1. Plants spiny; low-growing shrubs ..... ***Ceanothus*** (in part)
1' Plants unarmed; low to more often tall shrubs ..... (2)

2. Leaves opposite or nearly so; plants to 5 dm; leaves small, 8–17 mm long, thick; in dry sites ..... ***Ceanothus*** (in part)
2' Leaves alternate or fascicled; plants of various heights; leaves 20–120 mm long, thin; in shaded, mesic to wet sites ..... (3)

3. Flowers 4-merous, unisexual, styles deeply cleft; bud scales present ..... ***Rhamnus***
3' Flowers 5-merous, bisexual, styles lobed but not deeply cleft; bud scales absent ..... ***Frangula***

Ceanothus L. Buckbrush, Mountain Lilac, P–ih pit–a', Tinéctc'il

(Greek *keanothus*, for a kind of thorny plant) Erect to somewhat sprawling low shrubs. **STEMS** spinose-armed or unarmed, typically strongly branched, spreading to erect, bark gray-green, gray to brown, glabrous or pubescent, bud scales present. **LEAVES** deciduous to evergreen, alternate or opposite, petiolate, stipules persistent or deciduous, pubescent, pinnately veined or with 3 distinct veins rising from leaf base or venation inconspicuous, margins smooth or finely serrate above the middle. **INFL** a terminal or axillary cymose panicle, on a short to long peduncle. **FLOWERS** perfect, pedicellate, 5-merous; sepals short, petaloid; petals longer than sepals, showy, blue, purple, or white, concave or hoodlike, clawed at base, lobes strongly hooded; anthers enclosed in petal hood; ovary 3-carpellate, unilocular, style typically 3-cleft about 1/2 its length. **FRUIT** appearing drupelike when immature, becoming a septicidal 3-valved capsule at maturity; each valve with or without a horn. **SEEDS** single per locule. A genus of 50 species endemic to North America, reaching south to Guatemala, but best represented in California, where species are conspicuous components of coastal chaparral. Many species are cultivated as ornamentals and for their honey. Indigenous tribes used the leaves as a tea, a poultice, and to soothe lung ailments.

1. Leaves alternate, mostly deciduous, with 3 distinct veins arising from the base; plants spiny; flowers typically white ..... ***C. fendleri***
1' Leaves opposite, evergreen, venation inconspicuous, pinnate; plants unarmed; flowers typically blue ..... ***C. vestitus***

Ceanothus fendleri A. Gray **CP** (for botanist A. Fendler) Fendler's ceanothus. Sprawling, low shrub, 0.4–1.5 m. **STEMS** strongly branched, spreading to erect, with lateral branches ending in sharp spinose tips, young twigs green or gray-green, pubescent, becoming brown with age. **LEAVES** alternate, deciduous at higher elevations to evergreen at lower elevations; petiole short, 2–4 mm, stipules small, deciduous, blades 10–18 mm, with 3 distinct veins rising from leaf base or sometimes venation inconspicuous, elliptic to elliptic-obovate, dull green above, pale green or whitish below, pubescent, margins smooth or finely serrate, flat, not conspicuously thickened. **INFL** terminal or axillary in axils of 1–3-year-old branches, umbellate to racemose. **FLOWER** sepals white to green-white, 0.3–0.6 mm; petals white or sometimes pink-tinged, 1.2–2 mm. **FRUIT** viscid when young, 3-lobed, 3–5 mm wide, brown to black, lacking horns. Common in open, montane conifer woodlands and forests and in shrub communities. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, SMg; NMEX: McK, RAr, SJn; UTAH. 2285–2900 m (7500–9500'). Flowering: May–Jul. Fruit: Jun–Sep. Colorado and Utah south to Texas, Arizona, New Mexico, and Mexico. A very common shrub of the ponderosa pine community.

Ceanothus vestitus Greene (hairs on the leaves) Desert ceanothus. Erect, intricately branched, rounded shrub, 0.5–1 m. **STEMS** unarmed, strongly branched, erect, young twigs gray, gray-brown, or sometimes nearly white, pubescent, becoming gray-brown with age. **LEAVES** opposite, evergreen, petiole 1–2 mm or nearly absent, stipules evergreen, conspicuous, 1–2 mm, with a swollen base, blades 5–15 mm, obscurely pinnately veined, elliptic to elliptic-obovate, green or gray-green above, pale green or gray-green below, pubescent when young, margins smooth or with a few serrations, curled, concave above to rolled, thick. **INFL** terminal or axillary in axils of 1–3-year-old branches, umbellate, cymose panicle. **FLOWERS** with short to long pedicels, sepals white, 1–1.5 mm; petals blue to lavender or sometimes white, 2–3 mm. **FRUIT** not especially viscid when young, globose to 3-lobed, 4–5 mm wide, brown, each valve with a short, erect horn, 0.5–2 mm long. [*C. greggii* A. Gray]. Rare and local on sandstone ridges and rims in semiarid shrub communities and piñon-juniper woodlands above the San Juan and Colorado rivers. UTAH. 1525–1830 m (5000–6000').

Flowering: May–Jun. Fruit: Jul–Aug. True *C. greggii* occurs in Mexico only (Fross and Wilken 2006). Our material is **var. *franklinii*** (S. L. Welsh) J. R. Spence & K. D. Heil (for Ben Franklin, Utah state botanist), which is a distinctive variety with predominantly blue flowers endemic to the Colorado Plateau.

Frangula Mill. Alder Buckthorn

(medieval name for the genus) Erect to sprawling shrubs or small trees. **STEMS** unarmed, strongly branched, spreading to erect, bark gray-brown, red-brown, or gray, glabrous or pubescent, bud scales absent. **LEAVES** deciduous to evergreen, alternate, petiolate, stipules persistent, pubescent, pinnately veined, margins smooth or finely serrate. **INFL** in an axillary cyme, on a short to long, sometimes branched peduncle. **FLOWERS** perfect, pedicellate, 5-merous, sepals petaloid, often deciduous and falling away with upper hypanthium, petals shorter than sepals, lacking hood, often folded, clawed or not at base, anthers not enclosed in a petal hood, ovary of 3 carpels, each of 1 locule, style 2–3-lobed but not deeply cleft. **FRUIT** a purple-black spherical drupe with 2–3 stones. A genus of about 20 species, not always separated from *Rhamnus*, distributed primarily in the north-temperate zone.

Frangula betulifolia (Greene) Grubov (birchlike leaves) Birch-leaved buckthorn. Erect to sprawling shrub or small tree, 1–4 m. **STEMS** unarmed, strongly branched, erect or ascendent, occasionally prostrate, young twigs brown or gray-brown, sparsely pubescent, becoming gray with age; naked buds densely pubescent. **LEAVES** large, broadly elliptic to nearly orbicular, 4–12 cm long, 3–8 cm wide, tip abruptly rounded to indented, strongly pinnately veined, sparsely pubescent when young, becoming glabrous with age, dark green above, paler below, margins crenulate. **INFL** an axillary cyme of 4–12 flowers, on a long peduncle that is sometimes forked. **FLOWERS** small, inconspicuous, campanulate, sepals 1–2.5 mm, eventually deciduous; petals dull brown or green-brown, 0.8–1.2 mm, style short, to 1 mm. **FRUIT** a glabrous, purple or purple-black, spherical to obovate drupe, 6–10 mm long. [*Rhamnus betulifolia* Greene] Common around springs and in shaded dense riparian vegetation and other damp protected sites. ARIZ: Apa. Nav. COLO: LPl. NMEX: McK; UTAH. 1160–2130 m (3800–7000'). Flowering: Apr–May. Fruit: Jun–Jul. The large leaves of this species are popular with leaf-cutter bees (Megachilidae), which cut out pieces of leaf around the margins for their nests.

Rhamnus L. Buckthorn

(ancient Greek name for the genus) Erect to somewhat sprawling shrubs or small trees. **STEMS** unarmed, strongly branched, ascending to erect, bark gray-green, gray to brown, glabrous or pubescent, bud scales present. **LEAVES** deciduous to evergreen, alternate or opposite, petiolate, stipules persistent, simple, pinnately veined or with 3 distinct veins rising from leaf base or venation inconspicuous, margins smooth or finely serrate above the middle. **INFL** a terminal or axillary cymose panicle, on short to long pedicels. **FLOWERS** unisexual, short- to long-pedicelled, 4-merous, sepals triangular; petals 0 or 4, not showy, often shorter than sepals, lacking hood, often folded, clawed or not at base, anthers not enclosed in petal hood; ovary of 2–4 carpels, each of 1 locule, style typically deeply cleft into 2–4 segments about 1/2 its length. **FRUIT** a red, purple, or black spherical drupe with 2 stones. A genus of about 100 species, widespread in temperate and subtropical regions of the world. *Rhamnus cathartica* has been used as a purgative for centuries in Eurasia, and many other species have purgative chemicals in their bark. The drupes of some species are sources of yellow and green dyes.

Rhamnus smithii Greene (named for the collector Benjamin H. Smith) Smith's buckthorn. Erect, strongly branched shrub, 1–3 m. **STEMS** unarmed, erect, young twigs gray-yellow, pubescent, becoming glabrous with age; bud scales tan-brown, ciliate-margined. **LEAVES** alternate, in fascicles or rarely nearly opposite, evergreen, elliptic to ovate or oblong-lanceolate, blades 2–7 cm long, 1–3 cm wide, apex acute to obtuse, distinctly pinnately veined, green above, pale green to yellow-green below, pubescent or glabrous, margins serrulate to crenulate. **INFL** an axillary cyme with 2–4 flowers on short peduncles, sometimes branched. **FLOWERS** small, inconspicuous, sepals pale green-yellow, 1.5–2.5 mm; petals green-yellow to white, 0.7–1.5 mm, sometimes absent, styles deeply cleft into 2–4 segments. **FRUIT** a black spherical drupe, 5–9 mm wide, typically with 2 stones. Uncommon on slopes in woodlands and forests along riparian zones, in shaded moist sites, and sometimes on midelevation clay barrens. COLO: Arc. LPl. Mon. NMEX: RAr. 2000–2500 m (6500–8200'). Flowering: Jun. Fruit: Jul–Aug. Colorado and New Mexico.

ROSACEAE Juss. ROSE FAMILY

Genus descriptions by Kenneth Robertson
Species descriptions by Kenneth D. Heil and Noel H. Holmgren
Genus key by Kenneth D. Heil

(ancient Latin name for roses) Trees, shrubs, perennial or annual herbs, sometimes armed with thorns or prickles. **LEAVES** mostly stipulate, simple to palmately or pinnately compound, variously toothed or lobed, often with gland-tipped teeth, alternate. **INFL** bracteate, corymbs, racemes, spikes, panicles, solitary. **FLOWERS** actinomorphic, mostly perfect, hypanthium variously flat, cup-shaped, cylindrical, campanulate, turbinate, or urceolate, often enlarging in fruit, nectar ring inside; calyx lobes 5, sometimes with alternating epicalyx lobes, often persistent; petals 5, usually subcircular with irregularly erose margins and a short claw; stamens mostly 15 or more, rarely 5, perigynous on hypanthium, usually persistent; pistil 1–many-carpellate, distinct or infrequently connate, free or adnate to hypanthium; ovary superior or inferior, ovules 1 or 2 or rarely several per carpel, styles same number as carpels. **FRUIT** follicles, achenes, drupes, drupelets, or pomes. **SEEDS** usually lacking endosperm. $x = 7, 8, 9, 17$. About 100 genera, 3000 species, most abundant in north-temperate zone, especially western North America and eastern Asia. Likely the third most economically important plant family in North America, many species with edible fruit and also numerous ornamental plants (Cronquist, Holmgren, and Holmgren 1997a).

1. Plants herbs, sometimes woody at the very base ..... (2)
1′ Plants shrubs or small trees ..... (11)

2. Petals lacking; inflorescence a dense spike, flowers numerous; leaves pinnately compound ..... ***Sanguisorba***
2′ Petals present (minute in *Sibbaldia*); inflorescence either not a dense spike or flowers not numerous; leaves various ..... (3)

3. Leaves simple, crenate; petals 8–10, white; fruit a plumose achene; flowers solitary on scapose peduncles ..... ***Dryas***
3′ Leaves compound or variously divided; petals mostly 5; fruit not a plumose achene; flowers usually more than 1 ... (4)

4. Flowers yellow (or dark red in *Potentilla thurberi*) ..... (5)
4′ Flowers white or pink ..... (6)

5. Petals minute, narrow; leaflets toothed at apex; plants prostrate or mat-forming; of high elevations ..... ***Sibbaldia***
5′ Petals showy, not narrow; leaflets entire, lobed, or serrate; plants not prostrate or mat-forming; plants not limited to high elevations ..... ***Potentilla***

6. Leaves trifoliolate; plants with well-developed stolons; receptacle ripening into an accessory fruit ..... ***Fragaria***
6′ Leaves usually with more than 3 leaflets; plants lacking stolons; receptacle not ripening ..... (7)

7. Leaflets very numerous, mostly less than 6 mm long; petals usually clawed ..... ***Ivesia***
7′ Leaflets mostly 3–15, usually more than 6 mm long; petals mostly sessile ..... (8)

8. Flowers in a narrow raceme; upper 1/2 of mature hypanthium covered with hooked bristles; rare in our area ..... ***Agrimonia***
8′ Flowers in a branched inflorescence; hypanthium without hooks ..... (9)

9. Leaves pinnately lobed or compound or more usually lyrate-pinnatifid; styles at maturity elongate and conspicuous ..... ***Geum***
9′ Leaves palmately or pinnately lobed or compound, not lyrate-pinnatifid; styles at maturity not elongate and conspicuous ..... (10)

10. Style attached to near top of the ovary; leaves either palmately compound or pinnately compound with narrow leaflets ..... ***Potentilla***
10′ Style attached near the base of the ovary; leaves pinnately compound with broadly oval leaflets ..... ***Drymocallis***

11. Leaves compound ..... (12)
11′ Leaves simple ..... (15)

12. Flowers yellow; leaves pinnately compound, crowded and appearing to be palmate ..... ***Dasiphora***
12′ Flowers rose, white, or pink; leaves distinctly pinnate ..... (13)

13. Leaflets 11–15; small trees with orange berries (pomes); stems and/or leaves lacking prickles ***Sorbus***
13′ Leaflets 5–7; shrubs without orange berries; stems and/or leaves with prickles (14)

14. Leaves glaucous beneath; flowers white; fruit an aggregate of drupelets (a raspberry) ***Rubus***
14′ Leaves green, often pale; flowers rose or rarely white; fruit a hip ***Rosa***

15. Leaves opposite; petals 0; low desert ***Coleogyne***
15′ Leaves alternate; petals present; plants of various habitats (16)

16. Low mat-forming shrubs; flowers solitary or in dense spikes on leafless or merely bracteate scapes (17)
16′ Shrubs or small trees, never mat-forming; flowers various but not scapose or subscapose (18)

17. Flowers solitary, mostly 8 petals; leaves simple, crenate, white beneath; alpine tundra on limestone ***Dryas***
17′ Flowers in dense spikes, mostly 5 petals; leaves entire, in tight rosettes forming extensive hard mats on cliffs ***Petrophytum***

18. Ovary or ovaries superior, free from the hypanthium (19)
18′ Ovary inferior, 2–5 carpels fused and the fruit a pome (24)

19. Petals lacking, flowers inconspicuous; leaves entire, evergreen (except *C. montanus*) ***Cercocarpus***
19′ Petals present; flowers showy or small; leaves mostly toothed or lobed, not evergreen (20)

20. Pistil 1; fruit a drupe; leaves usually with glands at the base of the blade or on the petiole ***Prunus***
20′ Pistils 1 to many; fruit not a drupe; leaves without glands (21)

21. Flowers large, 2–5 cm across, in few-flowered cymes; leaves 2–15 cm wide, fruit an aggregate ***Rubus***
21′ Flowers less than 2 cm across, solitary or in corymbs; leaves up to 2 cm wide; fruit an achene, plumose-tailed or not (22)

22. Flower petals white, in terminal, many-flowered pyramidal clusters; usually on talus slopes and cliff faces ***Holodiscus***
22′ Flower petals white, cream, or pale yellowish; borne singly or in few-flowered cymes, various habitats (23)

23. Pistils numerous; petals white; leaf lobes tightly revolute; often in wash bottoms and roadsides ***Fallugia***
23′ Pistils 1–5; petals white to cream or pale yellow; leaf lobes not tightly revolute, various habitats ***Purshia***

24. Stems armed with thorns ***Crataegus***
24′ Stems unarmed (rarely so in *Malus*) (25)

25. Leaves narrowly elliptic, entire or indistinctly toothed ***Peraphyllum***
25′ Leaves serrate to doubly serrate (26)

26. Flowers white, in racemes; plants indigenous, rarely cultivated; leaves toothed at the apex ***Amelanchier***
26′ Flowers white or otherwise, in corymbs or short panicles; plants cultivated, sometimes escaping, leaves toothed or lobed ***Malus***

Agrimonia L. Agrimony

(corruption of *Argemone*, a name used by Pliny) Perennial herbs. **STEMS** unbranched below inflorescences. **LEAVES** imparipinnately compound, basal ones small, not persistent, cauline leaves interrupted, with small leaflets interspersed with larger leaflets, leaflet margins serrate, stipules persistent, resembling smallest leaflets, sometimes coarsely toothed. **INFL** of racemes terminating stems, pedicels short. **FLOWERS** perfect, yellow, small; hypanthium turbinate to hemispheric, throat constricted, outer rim with numerous hooked bristles that elongate and become indurate in fruit; sepals 5, spreading at anthesis, becoming incurved and forming a beak on the fruit, epicalyx absent; petals small, orbicular, deciduous; stamens 5–15; carpels 2, free from each other and from hypanthium, the ovary superior, inserted at base of hypanthium, styles terminal, stigmas terminal, ovaries superior **FRUIT** an accessory, 2 achenes enclosed within enlarged, indurate, 10-ribbed hypanthium, ring of hooked bristles around top of hypanthium. $x = 7$. About 18 species, 10 in North America.

Agrimonia striata Michx. (furrowed or channeled) Herbaceous perennial with rhizomes. **STEMS** erect and branched above, 30–100 cm tall, hirsute and somewhat glandular. **LEAVES** with 7–13 leaflets, 3–12 cm long, crenate-serrate, resinous-glandular beneath and sparingly hirsute only on the veins. **INFL** a raceme, 20–40 cm long. **FLOWER** calyx

tube in fruit mostly 5 mm long; petals obovate, about 5 mm long, yellow; stamens 5–15; pistils 1 or 2, stigmas 2-lobed. **FRUIT** 1 or 2 achenes. [*A. brittoniana* E. P. Bicknell; *A. brittoniana* var. *occidentalis* Bickn.]. Ponderosa pine communities. ARIZ: Apa; COLO: Arc, Hin, LPl; NMEX: SJn. 1675–2590 m (5500–8500'). Flowering: Jul–Sep. Nova Scotia to British Columbia, south to West Virginia, Colorado, Arizona, and New Mexico.

Amelanchier Medik. Serviceberry

(derived from *amelanche*, the French name of the European *A. ovalis*) Deciduous, unarmed shrubs or small trees. **STEMS** woody, bark smooth, pale, with shallow longitudinal fissures. **LEAVES** deciduous, alternate, simple, petiolate, toothed, pinnately veined; stipules linear, caducous. **INFL** racemose, leafy, sometimes reduced to a few-flowered cluster, appearing with the leaves, bracts linear, caducous. **FLOWERS** perfect, white, showy, large nectar ring present; hypanthium campanulate to urceolate, lower part adnate to the carpels at least at the base; sepals 5, persistent, epicalyx absent; petals 5, narrow, not clawed, flaccidly spreading, deciduous; stamens usually 20; carpels 2–5, fully connate, partially adnate to hypanthium, ovary about 1/2 inferior, styles connate below. **FRUIT** a fleshy pome, purple or orange to yellow or nearly white, the core thin or cartilaginous, false septa present, topped by persistent, recurved sepals. $x = 17$. About 33 species, mostly North American with a few species in Europe and eastern Asia.

1. Larger leaf blades (2) 2.5–6 cm long, sparsely pubescent to glabrous with age; styles (4) 5, united into a column below; petals 7–13 mm long; pome becoming fleshy and purplish at maturity ..... ***A. alnifolia***
1' Leaf blades 1–3 cm long; permanently pubescent; styles 2 or 3 (4 or 5), usually distinct to the base; petals 5.5–9 (10) mm long; pome more or less dry or mealy, orangish, yellowish, or whitish, but sometimes with a purplish tinge ..... ***A. utahensis***

Amelanchier alnifolia (Nutt.) Nutt. ex M. Roem. (leaves like the genus *Alnus*, alder) Saskatoon serviceberry, western serviceberry, shadbush. Shrub 1–4.5 m tall, bark of the young stems smooth, reddish brown, eventually becoming gray; herbage glabrous to sparsely puberulent when young. **LEAVES** with petioles 0.7–1.8 (2.8) cm long, stipules filiform, caducous, the blade (ob)ovate to suborbicular, (2) 2.5–6 cm long, 1.5–4.5 cm wide, obtuse, rounded, truncate, or subtruncate basally, obtuse, rounded, or sometimes retuse apically, serrate or coarsely toothed, usually from or beyond the middle, the veins often prominent beneath, the surface often green above and glaucous beneath. **INFL** a short, erect, 5–15-flowered raceme, variously pubescent to glabrous. **FLOWERS** fragrant; hypanthium brownish within; sepals becoming reflexed at anthesis, deltate-lanceolate to narrowly lanceolate, 1.8–4 (5.5) mm long, persistent; petals oblanceolate, 7–18 mm long, 2.5–6.7 mm wide, the claw pilosulous at the base, white; stamens 20, the filaments white, the anthers 0.5–0.8 mm long, brownish; styles (4) 5, united into a column below. **FRUIT** a globose pome, 7–10 mm thick, densely tomentose at the apex or sometimes completely glabrous, becoming fleshy and purplish at maturity, usually 10-seeded, edible. **SEEDS** 3.5–5 mm long, dark brown. $2n = 68$.

1. Herbage and inflorescence pubescent, glabrescent with age, the top of the ovary remaining densely hairy through development into a pome ..... **var. *alnifolia***
1' Herbage and inflorescence glabrous, including the top of the ovary (pome) ..... **var. *pumila***

var. *alnifolia* [*Pyrus alnifolia* (Nutt.) Lindl ex Ser.; *A. bakeri* Greene]. Gambel's oak, mountain mahogany, ponderosa pine, Douglas-fir, aspen, and spruce-fir communities. ARIZ: Apa, Nav; COLO: LPl, Min, Mon, SJn; UTAH. 2135–2745 m (7000–9000'). Flowering: May–Jun. Alaska, Yukon, British Columbia, Alberta east to Manitoba, south through Washington, Oregon, northern California, Idaho, Montana, and the Dakotas, Utah, northern Arizona, Colorado, and western Nebraska. Fruit eaten for food by the Navajo.

var. *pumila* (Torr. & A. Gray) C. K. Schneid. (dwarf) Dwarf serviceberry. [*A. pumila* Nutt ex Torr. & A. Gray; *A. polycarpa* Greene]. Gambel's oak, mountain mahogany, ponderosa pine, Douglas-fir, aspen, and spruce-fir communities. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, SJn; NMEX: McK, RAr, SJn. 2285–3350 m (7500–11000'). Flowering: May–Jun. Southern Canada south to Washington, Oregon, and northern California, east to Idaho, Montana, Wyoming, and south to northern Arizona and northern New Mexico.

Amelanchier utahensis Koehne (of Utah) Utah serviceberry. Shrub up to 3 dm tall, often much-branched, bark reddish when young, soon becoming gray. **LEAVES** with petioles 0.2–0.9 (1.4) cm long, stipules filiform, caducous, the blade (ob)ovate to suborbicular, (1) 1.5–3 dm long, 0.8–2 (2.3) cm wide, rounded basally, obtuse, truncate, or sometimes retuse apically, serrate or crenate-serrate, usually prominently tomentose on both surfaces, the veins prominent beneath. **INFL** a 3–6 (10)-flowered raceme, the pedicels, hypanthium, and sepals usually tomentose. **FLOWER** sepals

becoming reflexed at anthesis, lanceolate to narrowly lanceolate, 1.5–4.2 mm long, acute or acuminate; persistent petals oblanceolate, sometimes narrowly so, 5.5–9 (10) mm long, 1.7–3.7 (4.2) mm wide, narrowly cuneate below, white; stamens 15–20, the filaments white, the anthers 0.6–0.9 mm long, pale yellow turning brown; styles 2 or 3 (4 or 5) distinct to the base or nearly so. **FRUIT** a pome, globose to more or less pyriform, 5–10 mm thick, finely pubescent or glabrous, dry or at least not juicy at maturity, the flesh sometimes mealy, orangish, yellowish, or nearly white, often with a purplish tinge, 3–6-seeded. **SEEDS** 3.8–5.6 mm long, dark brown [*A. prunifolia* Greene; *A. crenata* Greene; *A. rubescens* Greene; *A. oreophila* A. Nelson]. Streamsides, foothills, and mountain slopes; grassland, mountain mahogany, Gambel's oak, mountain brush, piñon-juniper woodland, aspen, and ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr. Sln; UTAH. 1370–2460 m (4500–8065'). Flowering mid-Apr–May. Southern Washington, central Idaho, southwestern Montana, south through eastern Oregon, southern Idaho, western and southern Wyoming to eastern California, Nevada, northern Arizona, Utah, western Colorado, and northwestern New Mexico; Baja California. Our material belongs to **var *utahensis*** However *A. utahensis* var *covillei* (Standl.) N. H. Holmgren may be the same as what is called *A. prunifolia* Greene in Colorado and New Mexico. More collections and more study are needed to determine if var. *covillei* is found in the study area. The plant was used during labor and delivery and berries were dried for winter use by the Navajo. Hopi used the plant to make pahos (prayer sticks), and to make bows and arrows. The Ramah Navajo used the leaves as emetics in various ceremonies as a "life medicine," ate the berries raw or cooked, and used the stem as a ceremonial item (to make "Evil-way hoop")

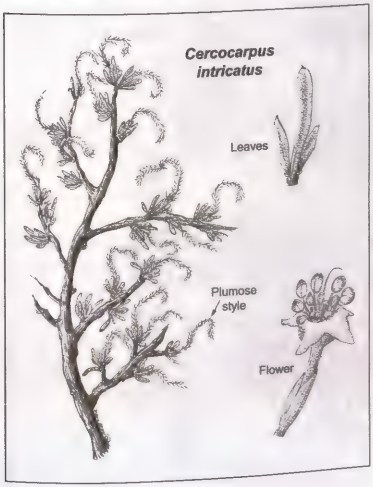
Cercocarpus Kunth Mountain Mahogany

(Greek *kerkos*, tail, + *karpos*, fruit) Evergreen shrubs or small trees, unarmed. **STEMS** woody, bark smooth, gray to reddish brown. **LEAVES** simple, clustered at tips of short shoots, entire or dentate, usually thick or coriaceous; lower part of stipules adnate to bases of petioles, the free parts caducous. **INFL** of solitary flowers or few-flowered clusters terminating short shoots; bracts small, membranaceous, caducous. **FLOWERS** perfect, sessile; nectar disc absent; not showy; hypanthium of 2 parts, lower part narrowly tubular, persistent, upper part cup-shaped, deciduous; petals absent; sepals 5, small, deciduous with the upper hypanthium; stamens 10–45, carpel 1, free from hypanthium; style terminal, persistent. **FRUIT** an achene, included in hypanthium, style greatly elongate, plumose. $x = 9$. About 13 species of western North America and Mexico.

1. Leaves linear; a highly and intricately branched low shrub; slickrock sites and cliffs ..... ***C. intricatus***
1' Leaves broader; a tall, open-branched shrub; various sites ..... (2)

2. Leaves entire, strongly revolute; often a small tree; rare in our area ..... ***C. ledifolius***
2' Leaves crenate-serrate; not strongly revolute; tall shrubs; widespread ..... ***C. montanus***

Cercocarpus intricatus S. Watson (entangled) Littleleaf mountain mahogany, dwarf mountain mahogany. Evergreen, small shrub, intricately branched, spinescent, up to 2.5 m high; young branches reddish brown, finely villous with crinkly white hairs or glabrous, older stems ashy gray. **LEAVES** with petioles 0.8–1.5 mm long; stipules lanceolate, brown, acute; blades linear, 5–15 mm long, 0.5–2 mm wide, mucronulate-tipped, entire, revolute-margined, dark green above. **INFL** of 1–3 flowers terminating short, lateral branches. **FLOWERS** subsessile; hypanthium tube persistent, 4–6 mm long, green, becoming pale brown with brown nerves with age; hypanthium cup rim 1–2 mm high, campanulate, reddish; sepals recurved, broadly deltate, 0.7–1.2 mm long, obtuse, pubescent within; stamens 10–15, anthers 0.8–0.9 mm long, glabrous. **ACHENES** about 6 mm long, ascending-pubescent, mature style 3–4.5 cm long, spirally coiled, plumose [*C. ledifolius* Nutt. var. *intricatus* (S. Watson) M. E. Jones; *C. arizonicus* M. E. Jones; *C. intricatus* var. *villosus* C. K. Schneid.]. Cracks and crevices of sandstone outcrops, or in shallow rocky soils; desert scrub and piñon-juniper woodland communities. ARIZ: Apa, Coc, Nav; COLO: Mon; NMEX: Sln. UTAH. 1495–2725 m (4900–8940'). Flowering: Apr–Jun. Southeastern California, Nevada, Utah, southwestern Colorado, northern Arizona, and northwestern New Mexico. Used for ceremonial items by the Hopi.

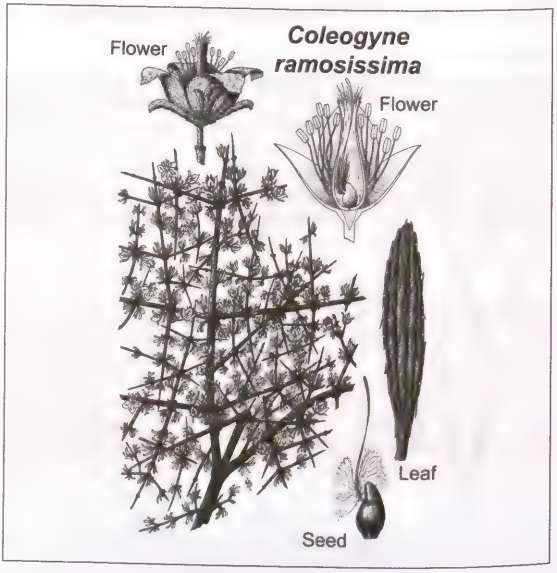


Cercocarpus ledifolius Nutt. (curl leaf) Curl-leaf mountain mahogany. Small tree or evergreen shrub, erect, up to 8 m tall, sharp, stiff branches, elongating branches reddish, villous or tomentose with crinkly white hairs, older branches ashy gray. **LEAVES** nonfascicled on elongating branches, with petioles 1–6 mm long, stipules brown, with a thick midvein, blade lance-elliptic, narrowly lanceolate, or linear, 1–4 cm long, mostly 2–8 mm wide, cuneate basally, acute apically, entire and revolute-margined, dark resinous green, sparsely lanate above when young, moderately to densely lanate beneath, midrib prominent. **FLOWERS** subsessile; hypanthium tube persistent, up to 13 mm long, lanate, hypanthium cup 1.5–3 mm high, reddish; sepals broadly deltate, mostly 1.2–2.4 mm long, rounded, recurved, woolly-pubescent; stamens 15–25, anthers 0.6–1.3 mm long, glabrous. **ACHENES** 7–9 mm long, mature style 4–10 cm long, bent or spirally coiled, plumose. $2n = 18$. [*C. ledifolia* Nutt. ex Hook. & Arn.; *C. ledifolius* var. *intercedens* C. K. Schneid.; *C. hypoleucus* Rydb.]. Mountain slopes; sagebrush, piñon pine, oak, and ponderosa pine communities. ARIZ: Apa; UTAH. 1920–2775 m (6300–9110'). Flowering: May–Jun. Southeastern Washington, southern Oregon, south to California, southern Idaho, Nevada, Utah, northern Arizona, and east to southwestern Montana, Wyoming, and western Colorado. Our material belongs to **var. *intermontanus*** N. H. Holmgren (between mountains).

Cercocarpus montanus Raf. (of mountains) Alderleaf mountain mahogany, birchleaf mountain mahogany. Deciduous shrub, up to 4 m tall, young branches reddish brown, older bark gray to brown, smooth. **LEAVES** with petioles 2.5–6 mm, stipules short, lanceolate, acute, light brown; blade ovate, rhombic, 12–50 mm long, mostly 8–20 mm wide, cuneate basally, rounded apically, margins crenate-serrate, plane or slightly revolute, dark green with impressed veins, pale beneath. **FLOWER** hypanthium cup 3–8 mm long; hypanthium tube persistent, 6.5–11 mm long, sericeous, becoming reddish brown; sepals deltate, 1–1.8 mm long, rounded, recurved; stamens 22–44, anthers 0.6–1 mm long, hirsute. **ACHENES** 9–12 mm long, mature style 5–9 cm long, spirally coiled, densely plumose. $2n = 18$. [*C. parvifolius* Nutt. ex Hook. & Arn.; *C. macrourus* Rydb.; *C. douglasii* Rydb.; *C. rotundifolius* Rydb.; *C. flabellifolius* Rydb.]. Sagebrush, piñon-juniper woodland, Gambel's oak, ponderosa pine, and Douglas-fir communities. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1525–2285 m (5000–7500'). Flowering: late Apr–May. Oregon east to Nebraska and South Dakota, and south through California, Nevada, Utah, Colorado, Arizona, New Mexico, western Oklahoma, and western Texas; Mexico. Four Corners material belongs to **var. *montanus***.

Coleogyne Torr. Blackbrush

(Greek *koleos*, sheath, + *gyne*, ovary, alluding to the hypanthium enclosing the pistil) Deciduous shrub with spine-tipped branches. **STEMS** woody, bark gray, with thin longitudinal fissures. **LEAVES** simple, crowded in fascicles terminating opposite short shoots, entire, coriaceous; stipules small, partially adnate to leaf bases, persistent. **INFL** of solitary flowers terminating short shoots; bracts persistent. **FLOWERS** perfect, pale to bright yellow, showy, nectar disc absent; hypanthium short, urceolate; sepals 4, petaloid; petals generally absent; stamens 30–40, inserted near the outer base of a peculiar membranaceous sheath that separates the stamens from the carpel; carpel 1, free from hypanthium. **FRUIT** a relatively large, leathery achene. $x = 8$. Monotypic, southwestern North America.



Coleogyne ramosissima Torr. (much-branched) Blackbrush. Shrub up to 2 m tall, divergent and often with spinescent branches, bark exfoliating, gray. **LEAVES** in fascicles on short lateral branches or in the axil of opposite leafless stipules, main leaves narrowly oblanceolate, 5–10 mm long, obtuse or mucronate apically, entire, strigose with appressed malpighian hairs. **INFL** of solitary flowers terminating the lateral branchlets; pedicel, hypanthium, and outside of the sepals strigose. **FLOWER** hypanthium short, turbinate; sepals arranged in 2 pairs, outer pair ovate, 4.5–7 mm long, acute, inner pair broadly

ovate, 5–7.5 mm long, all yellow and glabrous on the adaxial surface, green or purplish, strigose abaxially; petals rare, opposite the sepals, up to 12 mm long, yellow; torus narrowly pyriform, 4–6 mm long, with 5 subulate teeth at the apex, glabrous on the outside, white-villous inside; stamens 20–40, anthers 1–1.3 mm long, pistil 1, style persistent, exserted from the torus. **ACHENES** 3–4 mm long, glabrous. $2n = 16$. Often the dominant species in our area, commonly found on the Morrison Formation. ARIZ: Apa, Coc, Nav; UTAH. 1125–1905 m (3700–6255'). Flowering May–Jul. Southern California, southern Nevada, southern Utah, northern Arizona, and southwestern Colorado.

Crataegus L. Hawthorn

(Greek *krataigos*, ancient name for a flowering thorn) Small trees and shrubs, usually armed with stout thorns. **STEMS** woody, young bark smooth and often reddish, becoming gray, rough, and scaly or checked. **LEAVES** deciduous, alternate, petiolate, stipules often glandular-toothed, small and caducous, sometimes large and persistent on long shoots; blade simple, entire to variously toothed or lobed. **INFL** a corymb, cyme, or panicle terminating short, leafy shoots; bracts linear, glandular-toothed, caducous. **FLOWERS** perfect, white, showy; large nectar ring present; hypanthium cup-shaped to urceolate, lower part fully adnate to the carpels; sepals 5, reflexed at anthesis, entire or glandular-serrate, persistent or deciduous, epicalyx absent; petals more or less circular, deciduous; stamens 5–25; carpels 2–5, fully connate, fully adnate to the hypanthium and the ovary inferior; styles mostly free. **FRUIT** a fleshy pome containing pyrenes, 1 pyrene per carpel, red, purple, black, orange, or yellow, usually topped by persistent sepals. $x = 17$. Estimating the number of species is made difficult by apomictic complexes, but a current estimate is 186 species of North and Central America and Eurasia.

1. Thorns 1–3 cm long; mature pome purplish black ..... ***C. douglasii***
1' Thorns 2.5–6 cm long; mature pome dark red or reddish orange to dark brown ..... (2)

2. Thorns averaging more than 3.5 cm in length; petioles and lower surface of leaves pubescent at maturity, especially along the veins, teeth not strongly glandular-tipped; rare in the study area ..... ***C. macracantha***
2' Thorns averaging between 2.5–3.5 cm in length; petioles and lower surface of leaves glabrous at maturity, teeth with black glandular tips; common in the study area ..... ***C. erythropoda***

Crataegus douglasii Lindl. (for David Douglas, 1799–1834, Scottish botanical explorer) River hawthorn. Large shrub or small tree, 2–7 m tall, bark reddish or orange, smooth at first, becoming gray, armed with shiny, dark red, relatively short thorns 1–3 cm long; herbage pubescent to glabrate. **LEAVES** with petioles mostly 0.5–2 cm long, stipules lineal, glandular-toothed, caducous, the leaf blade lanceolate to rhombic-oblanceolate, 3–8.5 cm long, 2–6 cm wide, mostly less than 2 times as long as wide, cuneate basally, acuminate, acute, obtuse, or rounded apically, once- or double-serrate. **INFL** a few-flowered, flat-topped, corymbose panicle or raceme. **FLOWER** sepals recurved at anthesis, deltate-caudate, 2.7–3.6 mm long, entire or glandular-toothed, slightly villous on the upper surface; glabrous beneath; petals obovate to orbicular, 4.5–7.5 mm long, 5–7.8 mm wide, white; stamens 10 or more, filaments 3.5–6 mm long, white, anthers 0.8–1.1 mm long, pink; styles 3–5, 3.5–4.5 mm long, pale green. **FRUIT** a pome, broadly ovoid or globose, 8–10 mm in diameter when dried, bony, purplish black, glaucous; nutlets with a cavity on the ventral side. $2n = 34, 48, 68$. [*C. rivularis* Nutt.; *C. wheeleri* A. Nelson]. Mostly found in canyons along streams in piñon-juniper woodland and ponderosa pine communities. COLO: Arc, Hin, LPl, Mon; NMEX: SJn. 1830–2530 m (6000–8300'). Flowering May–early Jun. Our material belongs to **var. *rivularis*** (Nutt.) Sarg. (riparian). Northeastern Nevada, southeastern Idaho, southwestern Wyoming, Utah, central Arizona, western Colorado, and western and northern New Mexico.

Crataegus erythropoda Ashe (red-based) Rocky Mountain hawthorn. Shrub or small tree, 2–5 m tall, the bark of the young branches reddish, armed with relatively slender, recurved, dark brown thorns, mostly 2.5–3.5 cm long. **LEAVES** with petioles 1–2.2 cm long, usually winged distally, the blade rhombic-ovate, 4–8 cm long, 3–5.5 cm wide, broadly cuneate at the base, acute apically, coarsely double-serrate or often shallowly lobed in upper 1/2 or 2/3, teeth with black glandular tips, sparsely appressed-pubescent and shiny green above, glabrous and pale beneath, the veins impressed above and prominent beneath. **INFL** a glabrous (2) 5–10-flowered corymb. **FLOWER** sepals narrowly lanceolate or caudate, 3–4.3 mm long, often glandular-toothed; petals suborbicular, 5–8.5 mm long, clawed, white; stamens 5–8 (10), anthers 0.9–1 mm long, pink, rose, or purple; styles usually 5. **FRUIT** a subglobose pome, 7–10 mm in diameter, reddish orange or dark brown, glabrous; nutlets 5, plane on ventral surface. [*C. cerronis* A. Nelson]. Along streams and canyons. COLO: Arc, Hin, LPl, Min, Mon; NMEX: RAr, SJn. 1675–2895 m (5500–9500'). Flowering May–Jun. Southcentral Wyoming, western 2/3 of Colorado, northwestern and north-central New Mexico, east-central Arizona, and San Juan County, Utah. This is our most common hawthorn.

Crataegus macracantha Lodd. (big-thorned) Big-spine hawthorn. Shrub or small tree up to 7 m tall, with reddish bark, armed with thorns 3–7 cm long. **LEAVES** with petioles up to 2.5 cm long, pubescent at maturity, especially on the veins, blade broadly (ob)ovate, 4–7 cm long, 2–5 cm wide, weakly lobed above the widest point, once- or twice-serrate teeth, not strongly glandular-tipped, villous-pubescent on the lower surface, at least near the veins. **INFL** a flat-topped corymb. **FLOWER** sepals narrowly lanceolate, 4–6 mm long; petals obovate to orbicular, 6–8 mm long, white; stamens 20 or less, ours not over 10, filaments 4–5 mm long, anthers 1–1.2 mm long, white to rose or purple. **FRUIT** a globose to subglobose pome, about 7–11 mm in diameter, bright red to purplish, pubescent to glabrous, with 2–4 nutlets. [*C. florifera* Sarg.; *C. succulenta* Schrad. ex Link var. *occidentalis* (Britton) E. J. Palmer; *C. coloradensis* A. Nelson; *C. columbiana* Howell var. *occidentalis* (Britton) Dorn]. Hillsides and canyons. COLO: Arc; NMEX: RAr. 2000–2210 m (6560–7250′). Flowering: May. Eastern Canada to Saskatchewan, south to Pennsylvania, Nebraska, Colorado, and northwestern New Mexico. Our material belongs to **var. *occidentalis*** (Britton) Eggl. (western). Apparently rare in the Four Corners region.

Dasiphora Raf. Shrubby Cinquefoil

(Greek *dasy*, woolly, + *phor*, carry, for the hairy achenes) Deciduous shrubs, unarmed. **STEMS** woody, bark shiny brown, exfoliated when older. **LEAVES** with stipules adnate to base of petiole, extending as almost foliaceous free lobes, persistent; blade pinnately compound, 3–7-foliolate, leaflets serrate. **INFL** of solitary axillary flowers or cymose, bracts reduced leaves, persistent. **FLOWERS** perfect, yellow (in ours), showy; hypanthium saucer-shaped, free from carpels, nectar disc present; sepals 5 alternating with 5 epicalyx lobes, persistent; petals 5, obovate to orbicular, short claw at base, deciduous; stamens 20–25; carpels numerous, free from each other and from hypanthium, the ovaries superior, inserted on base of receptacle and a short hemispheric projection, style inserted laterally near base of ovary. **FRUIT** numerous achenes. Five to six species in the Northern Hemisphere, mostly in temperate regions. $x = 7$. A segregate of *Potentilla*, s.l.

Dasiphora fruticosa (L.) Rydb. (shrubby) Shrubby cinquefoil. Shrub, mostly 1–15 dm tall; current year's growth villous, the stem becoming glabrous with shreddy, reddish brown bark; leaves sericeous beneath. **LEAVES** with stipules sheathing, broadly lanceolate to ovate, acuminate; petioles up to 15 mm long; blade pinnate, mostly 5-foliolate; leaflets narrowly elliptic, 0.8–1.8 cm long, entire. **INFL** cymose or of solitary axillary flowers. **FLOWER** bractlets narrowly lanceolate, 4–6 mm long; sepals deltate-ovate, 4.5–6.5 mm long; petals cuneate-obovate to orbicular, 7–12 mm long, yellow; stamens 20–25, anthers 1–1.2 mm long; pistils numerous; style 0.8–1.5 mm long, laterally attached; stigma capitate. **FRUIT** hirsute. $2n = 14, 28$. [*Potentilla fruticosa* L.; *Sasiphora riparia* Raf.; *Pentaphylloides fruticosa* (L.) O. Schwarz; *Potentilla floribunda* Pursh; *Pentaphylloides floribunda* (Pursh) Á. Löve]. Moist meadows and along mountain streams. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn. 2285–3810 m (7500–12500′). Flowering: Jun–Sep. Alaska to Labrador, south to California, Nevada, northern and eastern Arizona, and New Mexico, and east to New Jersey; Eurasia. Popular as an ornamental.

Dryas L. Mountain Avens

(for the dryads of Greek mythology, wood nymphs) Low, evergreen, mat-forming undershrubs. **STEMS** much-branched, prostrate, rooting at nodes. **LEAVES** with stipules adnate to base of petiole, persistent; blade simple, coriaceous, entire, crenate, or subpinnatifid, white below. **INFL** scapose, flowers solitary; bracts absent or small. **FLOWERS** perfect, white to cream, showy; hypanthium saucer-shaped to campanulate, free from carpels, with a nectar ring; sepals 8–10, persistent, epicalyx absent; petals 8–10, elliptic to obovate, persistent; stamens many; carpels several to many, free from each other and the hypanthium, the ovaries superior, inserted on a flat receptacle, styles terminal, persistent. **FRUIT** an achene with greatly elongated plumose style. $x = 9$. Perhaps two to six species, depending on species delimitation; circumpolar, mostly in Arctic and alpine regions.

Dryas octopetala L. **CP** (eight-petaled) Mountain avens. Subshrub, mat-forming, scapose. **LEAVES** with stipules lanceolate, acute; petioles with black stipitate glands, 1–2.5 cm long; blades up to 2 cm long, mostly 4–8 mm wide, lanceolate or elliptic, rounded basally, obtuse apically, veins conspicuously impressed above, margins revolute, upper surface green, glabrous or with a few hairs along the midnerve, lower surface white-tomentose. **INFL** a solitary flower, scape 3–6 cm long, stipitate-glandular, tomentose. **FLOWER** hypanthium cupulate to subdiscoid; sepals 8–10, lanceolate, 4.5–8 mm long, glabrous on the inner surface; petals 8–10, elliptic or oblanceolate, 10–13 mm long, clawed, rounded apically, cream to white; anthers 0.5–0.6 mm long. **ACHENES** 2.5–4 mm long, style 2–3 mm long, silky plumose. $2n = 18, 36$. [*Ptilotum octopetalum* (L.) Dulac; *Dryadaea octopetala* (L.) Kuntze; *Geum octopetalum* (L.) E. H. L. Krause; *D. hookeriana* Juz.]. Limestone (ours of alpine tundra communities). COLO: LPl, SJn. 3625–3870 m (11900–12700′). Flowering: Jul–Aug. Alaska and Yukon south to the Cascades of Washington, northeast Oregon, and the Rocky Mountains of Idaho, northeast Utah, and Colorado. Very rare in our area.

Drymocallis Fourr. ex Rydb. Sticky Cinquefoil

(Greek *drymos*, woodland, + *calli*, trail) Ours perennial herbs up to 10 dm tall, herbage brownish viscid, some hairs glandular. **LEAVES** pinnate with a well-defined terminal leaflet. **FLOWER** petals white to cream, style fusiform, basally attached. Four species in North America.

Drymocallis arguta (Pursh) Rydb. (sharply toothed) Tall cinquefoil. Perennial herb, 5–10 dm tall, herbage brownish viscid-villous, the pubescence on the stems and rachis of the leaves shaggy **STEMS** mostly unbranched below the inflorescence. **LEAVES** pinnate, 7–9-foliolate, 1–2.5 dm long; upper cauline leaves few and reduced upward. **INFL** a narrow, mostly flat-topped cyme, viscid-villous; pedicels mostly 2–20 mm long, erect. **FLOWER** bractlets lanceolate, 3–5 mm long; sepals ovate, 5–10 mm long; petals obovate to orbicular, 4–8 mm long, white, cream, or pale yellow; stamens 25–30; anthers 0.6–1.1 mm long; pistils numerous; style 0.7–1.1 mm long, laterally attached below the middle of the ovary. **FRUIT** an achene 0.8–1.5 mm long, glabrous. $2n = 14$. [*Potentilla arguta* Pursh, *P. convallaria* Rydb.] Ponderosa pine, Gambel's oak, aspen, and spruce-fir communities. COLO: Arc, Hin, Mon; NMEX: RAr; UTAH: 2465–2925 m (8085–9600'). Flowering: May–Jul. Southern Canada south to northeastern Nevada, Utah, northeastern Arizona, northern New Mexico, east to New Jersey. Our material comes closest to **subsp. *convallaria*** (Rydb.) Soják, however, more research and collections are needed.

Fallugia Endl. Apache Plume

(named after Italian botanist Virgilio Fallugi) Deciduous or semievergreen shrubs, unarmed. **STEMS** woody, much-branched, erect; bark exfoliating, light gray with reddish fissures. **LEAVES** with small stipules, caducous, blades deeply pinnatifid, often in fascicles. **INFL** of solitary flowers or few-flowered loose cymes terminating stems, bracts few, reduced, leaf-like. **FLOWERS** mostly imperfect and the plants functionally dioecious, white, showy; hypanthium hemispheric, nectar disc absent; sepals 5, alternating with 5 linear epicalyx lobes, persistent; petals 5, subcircular, deciduous; stamens many; carpels many, free from each other and the hypanthium, the ovaries superior, style terminal. **FRUIT** an achene with a greatly elongated plumose style. $x = 7$. Monotypic, southwestern North America.

Fallugia paradoxa (D. Don) Endl. ex Torr. **CP** (not of the expected) Apache plume. Shrub, up to 2 m tall, with slender branches, sometimes evergreen. **STEMS** of the current season pale brownish tomentose, bark of the older branches light gray, exfoliating. **LEAVES** with small stipules, triangular, persistent, in fascicles, on short lateral branches, larger ones 7–20 mm long, pinnately 3–5 (9)-lobed, the larger lobes sometimes divided again, blades thick, strongly revolute-margined, midvein prominent, yellow-brown tomentose beneath. **INFL** of 1–3 flowers borne at the tip of slender, elongating branches. **FLOWERS** mostly unisexual, sometimes perfect; female flowers with sterile anthers, male flowers with sterile ovaries; hypanthium hemispheric, 2–4 mm deep, yellow-brown tomentose, bractlets lanceolate, 4–7 mm long, sometimes bifid, revolute margins; sepals ovate, 4–7.5 mm long, rounded, apiculate, glabrate and whitish on the inside, reflexed in fruit; petals spreading, suborbicular, 9–17 mm long, rounded apically, white; stamens about 100, in 3 series, filaments broadened at the base, cream-colored, anthers 0.9–1 mm long, yellow; receptacle densely short-hirsute. **ACHENES** 2.5–2.8 mm long, fusiform, densely pubescent; style elongating to 3–4 mm long, pink to purplish, sinuously curved, densely plumose. $2n = 14, 28$. [*Sieversia paradoxa* D. Don, *Geum paradoxum* (D. Don) Steud., *F. paradoxa* var. *acuminata* Wooton; *F. micrantha* Cockerell]. Canyon bottoms and wash banks, blackbrush and desert grassland communities. ARIZ: Coc; NMEX: McK; UTAH: 1435–2170 m (4710–7120'). Flowering late Apr–Sep. Southeastern California, southern Nevada, southern Utah, Colorado, through Arizona, New Mexico, and western Texas, northern Mexico. Extremely rare in the Four Corners region. Used as witchcraft to cause insanity by the Kayenta Navajo. An infusion of leaves used as a ceremonial lotion and ceremonial emetic by the Ramah Navajo.

Fragaria L. Strawberry

(Latin *fraga*, strawberry, the adjectival form used by Linnaeus referring to the fruit's fragrance) Perennial herbs. **STEMS** scaly crowns terminating underground rhizomes, producing stolons that root at nodes. **LEAVES** in rosettes, trifoliolate or simple in inflorescence, long-petiolate, stipules adnate to bases of petiole, persistent, forming scales on crowns; leaflets coarsely serrate. **INFL** few- to several-flowered cymes or short racemes, long-pedunculate, bracts often foliaceous, persistent. **FLOWERS** perfect or partially to wholly imperfect, white, showy; hypanthium saucer-shaped, free of carpels, lined with nectar disc; sepals 5 alternating with 5 lobes of an epicalyx, persistent; petals 5, circular or ovate, short-clawed at base, deciduous; stamens 20–35; carpels many, free from each other and from hypanthium, the ovaries superior, inserted on conelike receptacle, styles inserted adaxially near base of carpels. **FRUIT** accessory with many achenes on surface of enlarged, fleshy, red, fragrant receptacle, subtended by calyx and epicalyx. $x = 7$. About 12 species primarily of the north-temperate zone, extending southward to Patagonia, also Hawaii. Fruit eaten by many tribes.

1. Terminal tooth of the leaflets well developed, projecting beyond the adjacent lateral pair; inflorescence equal to or exserted beyond the leaves; leaves green or yellowish green on the upper surface, veiny ..... ***F. vesca***
1′ Terminal tooth of the leaflets relatively small, usually shorter than the adjacent lateral pair; inflorescence usually surpassed by the leaves; leaves glaucous on the upper surface, not so veiny ..... ***F. virginiana***

Fragaria vesca L. (little) Woodland strawberry. Stoloniferous, scapose herb from a branched caudex; pubescence of the scape, petiole, and pedicels spreading to ascending-pilose, leaves spreading-villous on the veins. **LEAVES** 3-foliolate, petiole 3–18 cm long, stipules lanceolate to broadly lanceolate, acuminate; leaflets ovate, mostly 3–6 cm long, 2–4.5 cm wide, terminal leaflet the largest, coarsely crenate-serrate in the upper 2/3, terminal tooth projecting beyond the adjacent lateral teeth, all leaflets glaucous beneath and green to yellowish green above, veins well developed. **INFL** a cyme, exceeding the leaves, 0.5–2 dm long, 3–15-flowered. **FLOWER** bractlets lanceolate to broadly lanceolate, mostly 4.5–7 mm long, acuminate, spreading to ascending in fruit; sepals lanceolate to broadly lanceolate, 4.5–8 mm long, acuminate, spreading to ascending in fruit; petals broadly obovate, mostly 5–8 mm long, rounded, white with some pinkish tinge; stamens 20, anthers 0.7–0.9 mm long. **FRUIT** with receptacle becoming fleshy, up to 1 cm broad. **ACHENES** 1.3–1.4 mm long. $2n = 14$. [*F. helleri* Holz.; *F. bracteata* A. Heller; *F. americana* (Porter) Britton]. Shady and moist coniferous woodland and aspen communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, SJn. 2285–3900 m (7500–12800′). Flowering: May–Jul. Southern British Columbia, southern Alberta south to California, Arizona, and New Mexico.

Fragaria virginiana Mill. **CP** (of Virginia) Mountain strawberry. Stoloniferous, scapose herb from a branched caudex; scapes 0.2–2.5 dm long, usually surpassed by the leaves; stolons, scape, petiole, and pedicels sparsely to densely appressed- or spreading-pilose; sparsely to abundantly silky-villous beneath. **LEAVES** 3-foliolate, petiole 2–14 cm long, stipules lanceolate to ovate, acuminate; leaflets narrowly to broadly obovate, 2.2–7 cm long, 1.3–4.5 cm wide, cuneate below, coarsely crenate-serrate in the upper 1/3–2/3, the terminal tooth reduced and often surpassed by the adjacent lateral teeth. **INFL** a cyme, 2–15-flowered. **FLOWER** bractlets lanceolate, 3–6.5 mm long; sepals lanceolate, 4–8 mm long, acuminate, spreading to ascending in fruit; petals obovate, 5–12 mm long, rounded, white or sometimes pinkish; stamens 20, anthers 0.7–1 mm long. **FRUIT** with receptacle fleshy, mostly 1 cm broad. **ACHENES** 1.2–1.4 mm long. $2n = 56$. [*Potentilla ovalis* Lehm.; *F. glauca* (S. Watson) Rydb.; *F. sibbaldifolia* Rydb.; *F. truncata* Rydb.; *F. platypetala* Rydb.; *F. prolifica* C. F. Baker & Rydb.; *F. pumila* Rydb.; *F. pauciflora* Rydb.; *F. firma* Rydb.]. Moist soils; meadows and coniferous forests. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; NMEX: RAr, SJn. 2255–3655 m (7400–12000′). Flowering: Jun–Jul. Alaska, Canada, south to California, west to Oregon, Nevada, Utah, northern Arizona, Colorado, and New Mexico. Our material belongs to **var. *glauca*** S. Watson (bluish gray).

Geum L. Avens

(a name used by Pliny, perhaps for *G. urbanum*) Perennial herbs with rosettes terminating short vertical rootstocks or elongated horizontal rhizomes, scaly from persistent leaf bases. **STEMS** leafy or scapose. **LEAVES** basal and sometimes also cauline, pinnately compound, often lyrate in outline, leaflets toothed, of different sizes, small ones interspersed with larger ones along rachis, the terminal one larger than lower ones; stipules persistent, those of basal leaves fully adnate to the bases of the petioles, forming membranaceous wings, those of cauline leaves free. **INFL** several- to many-flowered open cymes or corymbs; bracts reduced leaves. **FLOWERS** perfect, white to pink or yellow, showy; hypanthium saucer-shaped, discoid, or turbinate, free from carpels, with a small to prominent nectar ring; sepals 5, alternating with 5 epicalyx lobes, persistent; petals 5, broadly obovate to elliptic or circular, longer than or shorter than sepals, deciduous; stamens 20–many; carpels several to many, free from each other and the hypanthium, the ovaries superior, inserted on a hemispheric to cylindrical receptacle, styles terminal, of 2 types, entire and wholly persistent and becoming plumose on the fruit or jointed and geniculate near the middle, the apical part deciduous and leaving a hooked beak on the fruit. **FRUIT** an aggregate of achenes, the receptacle not enlarging but sometimes elevated above calyx on a stipe. $x = 7$, most species hexaploids with $n = 21$. About 60 species mostly of the Northern Hemisphere, many in Arctic, alpine, or moist boreal forest habitats.

1. Style jointed, the lower part persistent, with a terminal hook; leaves pinnately compound, with few unequal leaflets ..... (2)
1′ Style continuous, without a hook; leaves with many narrow segments ..... (4)

2. Sepals purple; petals violet ..... ***G. rivale***
2′ Sepals green; petals yellow ..... (3)

3. Portion of style below the hook glabrous or minutely pubescent, not glandular; terminal leaf segment not enlarged ..... ***G. aleppicum***
3' Portion of style below the hook with stalked glands; terminal leaf segment greatly enlarged ..... ***G. macrophyllum***

4. Flowers nodding; petals pinkish ..... ***G. triflorum***
4' Flowers erect; petals yellow ..... ***G. rossii***

Geum aleppicum Jacq. (of Aleppos, Syria) Yellow avens, Aleppo avens. Perennial herb from a thick, fleshy crown; herbage and inflorescence hirsute, the hairs bulbose-based; stems and petioles finely puberulent. **STEMS** few, erect, 4–12 dm tall, leafy. **LEAVES**: basal well developed, 15–28 cm long, petiolate, pinnately divided; blade obovate; terminal leaflet cuneate basally and often decurrent on the rachis, 3–5-lobed, double crenate-toothed; cauline leaves 3–5-foliolate with stipules up to 2 cm long, ovate. **INFL** a few- to several-flowered cyme on long pedicels. **FLOWERS** erect; hypanthium more or less discoid; bractlets linear to linear-lanceolate, 1.2–3.5 mm long, obtuse; sepals reflexed at anthesis, deltate-ovate, 3–7.5 mm long, acute, finely tomentulose on the inside; petals spreading, suborbicular or obovate, 4–7 mm long, obtuse to rounded, short-clawed, yellow; stamens numerous, anthers 0.4–0.6 mm long; receptacle clavate, up to 2 mm long; pistils 200–250, hairy. **ACHENES** elliptic, flattened, 3.5–4 mm long; mature style strongly geniculate and jointed, the lower segment 4–6 mm long, glabrous or sparsely eglandular-hirsute, hooked at the apex. $2n = 42$. [*G. strictum* Aiton; *G. decurrens* Rydb.]. Wet meadows and along streams. ARIZ, Apa, COLO, Arc, LPl, Mtn, Mon, RGr, SJn. 1965–3505 m (6450–11500'). Flowering: Jun–Aug. British Columbia to eastern Canada and northeastern and midwestern United States, and Washington, Oregon, and northern California, south to Arizona and New Mexico.

Geum macrophyllum Willd. (large-leaved) Large-leaved avens, bigleaf avens. Perennial herb from a thick, scaly crown; herbage and inflorescence hirsute, stems partly glandular-puberulent. **STEMS** few, erect, up to 12 dm tall. **LEAVES**: basal well developed, mostly 10–25 cm long, petiolate, pinnately divided; the terminal leaflet cordate-reniform, 3–5-lobed, the lobes coarsely toothed, many times larger than the main lateral leaflets; cauline leaves alternate, smaller, 3(7)-foliolate, leaflets oblanceolate, serrate, stipules leaflike, 6–18 mm long. **INFL** a divergently branched 4–9-flowered cyme with long pedicels. **FLOWERS** erect; hypanthium discoid; bractlets linear to lanceolate, 0.5–2.5 m long, obtuse; sepals reflexed at anthesis, deltate, mostly 3–6 mm long, finely tomentulose adaxially; petals spreading, obovate, 3.5–6.5 mm long, yellow; stamens numerous, anthers 0.4–0.6 mm long; receptacle clavate, 4–6 mm long; pistils about 250. **ACHENES** ovoid-elliptic, flattened, 2.2–3.2 mm long, mature style geniculate and jointed, glandular-puberulent, hooked at the apex. $2n = 42$. [*Geum urbanum* L. subsp. *oregonense* Scheutz; *G. perincisum* Rydb.]. Wet meadows and stream banks; ponderosa pine, Douglas-fir, aspen, white fir, spruce-fir communities. ARIZ, Apa, COLO, RGr, SJn, UTAH. 2335–3505 m (7670–11500'). Flowering: late May–Aug. Alaska to Greenland, south to California, Nevada, northern Arizona, northern New Mexico, and Michigan.

Geum rivale L. (growing by streams) Purple avens. Perennial. **STEMS** few, 25–60 cm tall, hirsute and glandular-pubescent. **LEAVES** basal, lyrate-pinnate; leaflets obovate, 2–10 cm long, doubly serrate to deeply incised, uneven in size; cauline leaves ternate. **INFL** 1–4-flowered cyme. **FLOWER** bractlets less than 1/2 as long as the sepals, narrowly linear; sepals 8–12 mm long, lanceolate to ovate-lanceolate, not reflexed, densely pilose, purplish; petals 6–10 mm long, fleshy-colored or yellow-tinged, purple-veined, clawed, flabelliform; receptacle short-hirsute, more or less stalked in fruit; mature style geniculate, the lower segment about 7–9 mm long, hirsute below and more or less glandular-pubescent; upper segment 4–5 mm long, hirsute, articulated to lower by a curved and hooked joint. **ACHENES** mostly 4 mm long, hirsute. Meadows in the subalpine. COLO: SJn. 3200 m (10500'). Flowering: Jun–Aug. Known from one location along Clear Creek Trail (*M. Douglas 54-411*). Northern United States from Washington to Maine, Wyoming, and Colorado.

Geum rossii (R. Br.) Ser. (for Captain J. C. Ross, Arctic explorer) Alpine avens, Ross' avens. Perennial herb from a thick caudex forming dense clumps up to 3 dm broad or greater; herbage glabrous to sericeous or villous. **STEMS** erect, subscapose, 0.5–2.5 dm tall, simple or branched. **LEAVES**: basal well developed, 3–14 cm long, pinnately divided; the lateral leaflets mostly 7–15 mm long, cleft 1/2 their length into narrow segments; cauline leaves reduced, sessile, ternate, pinnately toothed, with stipules. **INFL** a 1–4-flowered cyme. **FLOWER** hypanthium turbinate, 2.5–6 mm long, purple-tinged; bractlets lanceolate, 2.5 mm long, acute to obtuse; sepals erect, deltate-lanceolate, 3.5–5.5 mm long, acute to acuminate; petals spreading, broadly obovate to suborbicular, 5–9 mm long, short-clawed, yellow; stamens numerous, anthers 0.5–0.8 mm long; receptacle short, rounded; pistils few to many. **ACHENES** 2.5–4 mm long, fusiform-lanceolate, pubescent, mature style not jointed or hooked, persistent, glabrous, about as long as the achene. $2n = 56, 70, 112$. [*Sieversia rossii* R. Br.; *Potentilla nivalis* Torr.; *G. sericeum* Greene; *P. gracilipes* Piper; *Sieversia scapoidea* A. Nelson; *Acomastylis rossii* (R. Br.) Greene]. Alpine and subalpine meadows. COLO, Arc, Con, Hin, LPl, Mtn, Mon, RGr.

SJn. 3220–3960 m (10560–13000'). Flowering: Jul–Aug. Alaska south to Washington and Oregon, northeastern Nevada, Utah, north-central Arizona, east to southwest Montana, Wyoming, Colorado, and New Mexico; Asia. Four Corners regional material belongs to **var. *turbinatum*** (Rydb.) C. L. Hitchc.

Geum triflorum Pursh (three-flowered) Old man's whiskers. Perennial herb from a thick caudex, branching to form clumps up to 3 dm broad or greater; herbage hirsute or pilose, often densely so. **STEMS** erect, 1.5–4 dm tall, subscapose with a pair of opposite, much-reduced leaves at about the middle. **LEAVES**: basal well developed, mostly 6–15 cm long, oblanceolate in outline, petiolate, pinnately lobed, becoming somewhat pinnatifid above, the lateral leaflets 13–22 mm long. **INFL** a 1–3 (9)-flowered cyme, the flowers nodding on long pedicels. **FLOWER** hypanthium hemispheric; bractlets linear to narrowly lanceolate, 6–15 mm long, acute; sepals erect, lanceolate, 7–13 mm long, acute; petals erect, narrowly to broadly elliptic, 8–15 mm long, white to pinkish; stamens numerous, from a ring within the hypanthium, anthers 0.8–1 mm long; receptacle short-clavate, to 2 mm long, short-pubescent; pistils numerous. **ACHENES** mostly 3 mm long, pyriform, the mature style slightly geniculate and jointed, the persistent lower segment 2–3.4 mm long, purplish, not hooked at the apex. $2n = 42$. [*G. ciliatum* Pursh; *Erythrocoma brevifolia* Greene; *E. arizonica* Greene; *E. grisea* Greene; *E canescens* Greene; *E. tridentata* Greene]. Montane meadows to alpine tundra. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn. 2180–3780 m (7150–12400'). Flowering: late May–Jul. British Columbia to Newfoundland, south through the mountain states to eastern California, Nevada, northern Arizona, and northern New Mexico, and in the Midwest, Great Lakes region, and New York. Our material belongs to **var. *ciliatum*** (Pursh) Fassett. A decoction of roots was given to stimulate tired horses by the Paiute.

Holodiscus (K. Koch) Maxim. Oceanspray

(Greek *holos*, entire, + *discos*, referring to the hypanthium) Deciduous, unarmed shrub. **STEMS** woody, bark reddish when young, becoming gray. **LEAVES** simple, entire, toothed, or shallowly lobed; stipules absent. **INFL** large, showy, diffuse, many-flowered panicles or racemes; bracts small. **FLOWERS** perfect, white to cream, small; hypanthium saucer-shaped, free from carpels, with a prominent nectar ring; sepals 5, persistent; petals 5, ovate, short claw at base; stamens 15–20; carpels 5, free from each other and the hypanthium, the ovaries superior, styles terminal. **FRUIT** an achene. $x = 9$. About five to eight species of western North America southward to northern South America.

Holodiscus dumosus (S. Watson) A. Heller (bushy) Bush oceanspray. Shrub, up to 2 m tall, the terminal branches often becoming weakly spinescent. **STEMS** of the current year reddish tan. **LEAVES** with oblanceolate to obovate blades, 2.5–3.5 cm long, mostly 0.5–1.2 cm wide, toothed above the middle, pilose above, lower surface less pubescent and with sessile, glandular hairs; short petioles. **INFL** a diffuse panicle, flowers subtended by bractlets. **FLOWER** sepals ovate, 1.2–2 mm long, petals spatulate, 1.7–2.5 mm long, white to cream; hypanthium discoid to shallowly cupulate, 1.8–2.3 mm across; stamens 20, anthers about 0.3 mm long; stigma discoid. **ACHENES** 1.5–2 mm long, densely pilose with spreading hairs. $2n = 36$. [*Spiraea dumosa* Nutt. ex Hook.; *Spiraea discolor* Pursh var. *glabrescens* Greenm.; *H. microphyllus* Rydb.]. Rocky sites, often steep canyon cliff faces; piñon-juniper woodland and ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, Mon; NMEX: McK, SJn; UTAH. 1870–3010 m (6145–9875'). Flowering: Jun–Aug. Eastern Oregon, southern Idaho, and Wyoming, south through California, Nevada, Utah, Arizona, New Mexico, Trans-Pecos Texas, and Mexico. Our material belongs to **var. *dumosus***. A decoction of the leaves is taken for influenza by the Ramah Navajo.

Ivesia Torr. & A. Gray Mousetail, Ivesia

(for Eli Ives, pharmacologist at Yale University) Perennial herbs with thick, simple to much-branched caudex, persistent leaf bases crowded at top. **STEMS** and other aboveground parts mostly covered with resinous, fragrant glands. **LEAVES** pinnately compound, mostly in basal rosette, cauline reduced upward, leaflets deeply lobed, tightly overlapping, the terminal leaflet usually reduced and confluent with rachis, sometimes individual leaflets barely distinguishable; stipules adnate to base of petiole, persistent, sometimes sheathing. **INFL** scapose, lax to condensed cymes; bracts reduced leaves. **FLOWERS** perfect, white to pale or greenish yellow; hypanthium saucer- to cup-shaped, campanulate, or turbinate, free from carpels, lined with nectar disc; sepals 5, usually alternating with 5 epicalyx lobes, persistent; petals mostly oblanceolate or linear to broadly obovate, often clawed at base, larger than to much smaller than sepals, deciduous; stamens 5 or 15–35; carpels few in most species, 1–20, free from each other and the hypanthium, the ovaries superior, the style subapical, more or less basally rough-thickened or swollen, the thin upper part deciduous. **FRUIT** an achene. $x = 7$. About 30 taxa of the western United States and northern Baja California.

Ivesia gordonii (Hook.) Torr. & A. Gray (for Alexander Gordon, an English horticulturist and nurseryman who traveled in the western United States) Gordon's ivesia, alpine ivesia. Subscapose herb from a thick caudex. **STEMS** erect,

spreading, or prostrate, 0.6–4 dm long, with 1 or 2 reduced leaves, glandular-puberulent. **LEAVES** basal, odd-pinnate, 3–24 cm long, pilose to glabrate; leaflets sometimes glandular-punctate, lateral leaflets 10–25 pairs, 2–17 mm long. **INFL** a capitate cyme, bracts palmately 5–7-parted, pedicels 1–2 mm long. **FLOWERS** campanulate or turbinate, 2–4.5 mm deep, yellowish green; bractlets narrowly elliptic to linear, mostly 1.3–3.3 mm long, obtuse or rounded, pale green; sepals deltate-lanceolate, 1–5 mm long, acute or acuminate, yellowish green; petals spatulate, 1.3–2.7 mm long, yellow, sometimes drying white; stamens 5, yellow, anthers 0.4–0.8 mm long, pistils mostly 2, sometimes 1–6, style yellow. **ACHENES** mostly 1.7–2 mm long, smooth. $2n = 28$. [*Horkelia gordonii* Hook., *Potentilla gordonii* (Hook.) Greene]. Shallow, rocky, limestone soils; subalpine to alpine communities. COLO. LPl. SJn. 3585 m (11760'). Flowering Jun–Aug. Montana and Washington, south to Colorado and California. Known from one collection on the Lime Ridge Trail northeast of Durango, Colorado (*Heil 24634*) and a 1935 collection near Lime Creek.

Malus Mill. Apple

(classical name of the apple) Deciduous trees, unarmed or with thorns. **STEMS** woody, bark smooth with horizontal lenticels or with scaly plates. **LEAVES** deciduous, simple, toothed or lobed; stipules small, deciduous. **INFL** of corymbs, panicles, or umbels; bracts small, caducous. **FLOWERS** perfect, white to pink, showy, large nectar ring present, hypanthium saucer- to cup-shaped, the lower part fully adnate to the carpels; sepals 5, persistent or deciduous, epicalyx absent; petals circular or broadly elliptic, slightly to distinctly clawed at base, deciduous; stamens 15–30; carpels 3–5, fully connate and fully adnate to the hypanthium, the ovary inferior, styles fused at base. **FRUIT** a large, fleshy pome, red to yellow or green, the core cartilaginous. $x = 17$. About 50 species of Eurasia and North America. *Malus ioensis* and related species are sometimes placed in the segregate genus *Chloromeles*.

1. Leaves on elongated shoots lobed or notched ..... ***M. ioensis***
1' Leaves on elongated shoots neither lobed nor notched ..... ***M. pumila***

Malus ioensis (Alph. Wood) Britton (refers to Iowa) Prairie crab apple. Small tree up to 9 m tall, branchlets tomentose, sometimes spinescent. **LEAVES** ovate to oblong, 2.5–10 cm long, tomentose on both sides. **FLOWER** petals white to pink, 12–25 mm long. **FRUIT** 2–3 cm in diameter. [*Pyrus ioensis* (Alph. Wood) L. H. Bailey] Cultivated tree that persists and escapes. COLO: LPl, Min, Mon; NMEX: SJn; UTAH. 1350–2315 m (4425–7600'). Flowering Apr–May. Widespread throughout North America.

Malus pumila Mill. (dwarf) Common apple. Tree up to 10 m tall, branchlets tomentose when young, becoming glabrous in age. **LEAVES** ovate to oblong or elliptic, 1.5–10 cm long, tomentose on 1 or both sides. **FLOWER** petals mostly white, often pink dorsally, 12–25 mm long. **FRUIT** mostly 2.5–12 cm in diameter, red, reddish purple, or yellow [*M. domestica* Borkh.]. Widely cultivated throughout the Four Corners region. ARIZ: Apa; COLO: Arc, Mon, SJn; NMEX: SJn; UTAH. 1615–2850 m (5300–9350'). Flowering: Apr–May. Widespread throughout North America.

Peraphyllum Nutt. Peraphyllum

(from the Greek *pera*, excessive, + *phyllon*, leaf, for the abundant leaves) Deciduous, unarmed shrub. **STEMS** woody, bark reddish when young, becoming gray, smooth. **LEAVES** simple, faintly toothed; stipules small, caducous. **INFL** reduced, 1- to few-flowered fascicle, bracts small, caducous. **FLOWERS** perfect, white to pinkish, showy, nectar disc present; hypanthium subglobose to turbinate, lower part fully adnate to the carpels; sepals 5, persistent, epicalyx absent; petals 5, obovate to circular, deciduous; stamens 15–20; carpels 2–3, fully connate and fully adnate to the hypanthium, the ovary inferior, styles mostly free. **FRUIT** a small fleshy pome, globose, yellow to orange or red, the core cartilaginous, false septa present. $x = 17$. Monotypic, western North America, a distinct relative of *Amelanchier*.

Peraphyllum ramosissimum Nutt. (many branches) Squaw apple. Shrub 0.5–2 m tall, bark reddish on young growth, becoming gray, herbage appressed-pubescent. **LEAVES** clustered on short shoots or alternate on elongating branches, petiole 1.5–4.5 mm long, stipules reddish, deciduous, the blade narrowly elliptic or narrowly oblanceolate, 2–5 cm long, 0.4–1.2 cm wide, narrowly cuneate basally, gradually tapering to the petiolate base, acuminate or acute or sometimes rounded or obtuse apically, entire or shallowly serrulate. **INFL** a fascicle of solitary or 2 or 3 flowers, terminating on short shoots appearing with the mature leaves, pedicels 0.4–1.3 cm long. **FLOWERS** fragrant, hypanthium campanulate or cylindrical, the free part 2–4 mm long; sepals spreading to reflexed, lanceolate to deltate, 2–5.5 mm long, white-tomentose on the inside, sometimes also on the outside; petals broadly obovate, 5–10 mm long, clawed, white to pinkish; stamens 15–20, the filaments 4–6.5 mm long, the anthers 0.9–1.2 (1.4) mm long; styles 2 (3). **FRUIT** a globose pome, 8–10 (12) mm in diameter, yellowish to reddish, with a bitter taste. **SEEDS** about 5 mm long, bluish purple, ovoid. $2n = 34$. Sagebrush, serviceberry, piñon-juniper woodland, and Gambel's oak communities. COLO: Arc,

Dol, LPl, Mon, SMg; NMEX: RAr, SJn; UTAH. 1870–2345 m (6130–7700′). Flowering: May–Jun. Eastern California, eastern Oregon, and adjacent Idaho, Nevada, southern and central Utah, western Colorado, and northwestern New Mexico.

Petrophytum Rydb. Rock-spiraea

(Greek *petra*, rock, + *phyton*, plant, in reference to the rocky habitat) Prostrate, mat-forming shrubs. **STEMS** woody, branched, condensed, covered with persistent leaf bases. **LEAVES** simple, entire, densely crowded on stems; stipules absent. **INFL** a compact spikelike raceme on an elongated scape bearing reduced leaves. **FLOWERS** perfect, white, small, nectar disc present; hypanthium cup-shaped to turbinate, free from carpels; sepals 5, persistent, epicalyx absent; petals 5, oblanceolate, persistent; stamens 20–40; carpels usually 5, free from each other and the hypanthium, the ovaries superior, styles terminal. **FRUIT** a follicle, dehiscent on both sutures. $x = 9$. Four species of western North America, a distinct segregate of *Spiraea*.

Petrophytum caespitosum (Nutt.) Rydb. (tufted) Rock-spiraea, tufted rockmat. A mat-forming shrub; herbage sericeous. **STEMS** much-branched, up to 25 cm long. **LEAVES** sessile, linear-spatulate to oblanceolate, 3–30 mm long, mostly 2–4 mm wide, apically obtuse. **INFL** a dense cylindrical to globular raceme, 2–4 cm wide, compound below with short lateral branches; pedicels 0.5–1.5 mm long. **FLOWERS** turbinate or cupulate, 0.5–1 mm deep, sericeous; sepals ovate to deltate, 1–1.6 mm long, acute; petals oblanceolate, 1.5–2 mm long, rounded to truncate, white; stamens mostly 20, filaments 2–3 mm long, anthers 0.3–0.5 mm long; style 2–3 mm long. **FOLLICLES** 1.2–1.5 mm long, pilose. $2n = 18$. [*Spiraea caespitosa* Nutt.; *S. caespitosa* var. *elatior* S. Watson; *P. elatum* (S. Watson) A. Heller; *P. acuminatum* Rydb.]. In our region, on steep, exposed, andesite porphyry and sandstone rock surfaces; rooting in the cracks of the rock. ARIZ: Apa, Nav; UTAH. 1215–2075 m (3700–6810′). Flowering: Aug–Sep. South Dakota, Montana, and Idaho south to Trans-Pecos Texas, Arizona, New Mexico, and northern Mexico. The Kayenta Navajo used the plant as a charm or prayer in the "Pleiades rite," and as a narcotic.

Potentilla L. Cinquefoil

(diminutive of Latin *potens*, powerful, for the supposed medicinal properties of *P. anserina*) Perennial or rarely annual herbs. **STEMS** ascending to erect or spreading, rarely decumbent, often with long rhizomes with persistent leaf bases, plants in rosettes, caespitose, or with runners rooting at nodes. **LEAVES** cauline and basal, palmately or pinnately compound with 3–15 leaflets, lower leaves long-petiolate; leaflets entire, lobed, or serrate; stipules of basal leaves adnate to the petioles, those of cauline leaves often free. **INFL** a narrow or open cyme, 1- to several-flowered, or solitary at the nodes; pedicels up to 2.5 cm long, bracts often foliaceous, persistent. **FLOWERS** perfect, mostly pale to bright yellow, rarely dark red, showy; hypanthium saucer-shaped, free of carpels, lined with nectar disc; sepals 5 alternating with 5 lobes of an epicalyx, persistent; petals 5, circular, obovate, or cuneate, short-clawed at base, deciduous; stamens 10–30, often 20; carpels many, free from each other and from hypanthium, the ovaries superior, inserted on conelike receptacle, styles terminal, inserted laterally to nearly basal on adaxial side of carpels. **FRUIT** accessory with many achenes on the dry receptacle, surrounded or enclosed by persistent, sometimes accrescent calyx. $x = 7$. A taxonomically diverse and difficult genus with several hundred species mostly of the north-temperate zone. In this treatment, *Potentilla* is treated largely sensu lato; segregate genera recognized here are *Dasiphora*, *Drymocallis*, and *Ivesia*.

1. Annual, biennial, or short-lived perennial; mostly weedy plants ..... (2)
1′ Perennial; native plants ..... (3)

2. Lowermost leaves 5–9-foliolate; achene with a protuberance on the ventral suture ..... ***P. paradoxa***
2′ Lowermost leaves 3-foliolate; achene lacking a protuberance ..... ***P. norvegica***

3. Style shorter than 1.2 mm, mostly thick and conical, thick just below the stigma, shorter than the achene ..... (4)
3′ Style longer than 1.2 mm, usually much longer, usually thin just below the stigma and longer than the achene ..... (6)

4. Principal basal leaves 5–15-foliolate, with revolute margins; montane to alpine ..... ***P. pensylvanica***
4′ Basal leaves 3–5 (7)-foliolate, margins not revolute; alpine ..... (5)

5. Basal leaves 5–7-foliolate; petioles spreading-pilose ..... ***P. rubricaulis***
5′ Basal leaves 3 (5)-foliolate; petioles densely tomentose ..... ***P. nivea***

6. Leaves pinnate with (5) 7 or more leaflets ..... (7)
6′ Leaves digitate or subdigitate, or occasionally 5-digitate above with 1 or 2 extra leaflets separated by a long rachis internode ..... (14)

7. Plants stoloniferous; flowers solitary at the nodes ..... ***P. anserina***
7′ Plants not stoloniferous; flowers few to several in cymes ..... (8)

8. Leaves subdigitate, with 7 leaflets ..... (9)
8′ Leaves definitely pinnate, with 9 or more leaflets ..... (10)

9. Leaves with 3 terminal leaflets and 2 lower pairs, leaflets narrowly toothed; mostly alpine ..... ***P. subjuga***
9′ Leaves highly variable, some pinnate and some digitate; upper leaflets mostly 5, lower montane to higher montane ..... ***P. pulcherrima* × *hippiana***

10. Leaves sericeous-strigose to glabrate, not tomentose, often appearing green ..... ***P. ovina***
10′ Leaves densely hirsute to tomentose, appearing silvery or grayish green on the lower surface ..... (11)

11. Leaves folded, 3-toothed in the upper 1/3, narrow, silvery hirsute ..... ***P. crinita***
11′ Leaves not folded, several-toothed throughout their length, broader, densely tomentose below, often bicolored ..... (12)

12. Leaves densely tomentose on lower surface ..... ***P. hippiana***
12′ Leaves green on upper and lower surface, merely strigose ..... (13)

13. Stems 6–7 dm tall; leaflets coarsely serrate, not folded ..... ***P. ambigens***
13′ Stems 1–4 dm tall; leaflets toothed at apex, folded ..... ***P. crinita***

14. Leaves strictly digitate, no rachis between the leaflets; bicolored or green on both surfaces ..... (15)
14′ Leaves subdigitate, with at least a short rachis visible between the leaflets on some leaves; the surfaces various ..... (18)

15. Leaflets green on both surfaces ..... ***P. diversifolia***
15′ Leaflets green above and white-tomentose beneath ..... (16)

16. Stems 2–8 dm tall; leaflets mostly 7 ..... ***P. pulcherrima***
16′ Stems 0.2–2.8 dm tall; leaflets mostly 5 ..... (17)

17. Leaves legumelike; leaflets mostly 2- or 3-toothed at the apex ..... ***P. bicrenata***
17′ Leaves not legumelike; leaflets toothed to shallowly lobed ..... ***P. concinna***

18. Petals rose-red or dark red ..... ***P. thurberi***
18′ Petals yellow ..... (19)

19. Leaves with 3 terminal leaflets and 2 lower pairs, leaflets narrowly toothed; mostly alpine ..... ***P. subjuga***
19′ Leaves highly variable, some pinnate and some digitate; upper leaflets mostly 5, lower montane to higher montane ..... ***P. pulcherrima* × *hippiana***

Potentilla ambigens Greene (wandering) Silkyleaf cinquefoil. Perennial. **STEMS** stout, silky-villous, up to 7 dm tall. **LEAVES**: basal pinnate, up to 20 cm long; leaflets 9–15-foliolate, larger leaflets 3–6 cm long, coarsely serrate, silky-villous below, more or less glabrous above, color contrast not striking. **INFL** a narrow cyme. **FLOWER** bractlets as long or longer than the sepals; sepals mostly 6–7 mm long, lanceolate, strigose; petals about 8 mm long, yellow; style filiform near the apex. **ACHENES** glabrous. Meadows. COLO: Arc. 2285 m (7500′). Flowering Jun–Aug. Wyoming, Colorado, and New Mexico. Known from one location south of Pagosa Springs along Rito Blanco Creek (*Heil 10095*).

Potentilla anserina L. (goose) Stoloniferous perennial, the stolons up to 50 cm long and producing a rosette of leaves at each node. **LEAVES** pinnate, 8–20 cm long, 9–25-foliolate, larger leaflets interspersed with smaller ones, the petioles hairy; larger leaflets oblanceolate to cuneate-obovate, 1–4 cm long, toothed or lobed, sparsely appressed-villous to glabrate above, white-tomentose beneath. **FLOWERS** solitary at the stolon nodes, pedicels 3–15 cm long, silky-tomentose; hypanthium saucer-shaped; bractlets lanceolate or ovate-elliptic, 4–7 mm long, sepals deltate or ovate, 3–5 mm long, acuminate to acute, erect with fruit development; petals obovate, 5.5–11 mm long, yellow, rounded, stamens 20–25, filaments flattened, broad at the base, anthers 0.7–1 mm long; pistils numerous on a flat receptacle, style 1.5–2.5 mm long. **ACHENES** ovoid, about 2 mm long, light brown. $2n = 28, 42$. (*Fragaria anserina* (L.) Crantz, *Argentina anserina* (L.) Rydb.). Floodplains, lakeshores, meadows, and other wet areas. ARIZ: Apa; COLO: Arc, Hin, Sln, NMEX: McK, RAr, SJn. 1700–3125 m (5575–10225′). Flowering: May–Sep. Alaska south to California, northern two-thirds of Nevada, Arizona, and New Mexico; Eurasia.

Potentilla bicrenata Rydb. (two notches, pertaining to the notched leaflets) Elegant cinquefoil. Perennial herb from a branched caudex. **STEMS** ascending at anthesis, prostrate in fruit; 0.2–0.8 dm long. **LEAVES** mostly basal, digitate, 5–7 (9)-foliolate; petiole 2–10 cm long, leaflets oblanceolate, 10–40 mm long, terminal the longest, entire or 2- or 3-toothed at the apex, green above and white-tomentose beneath. **INFL** mostly 2- or 3-flowered cyme; pedicels 1.5–2 cm long. **FLOWER** bracts lanceolate, 2–4 mm long, acute; sepals dentate-lanceolate, 2.5–5.5 mm long, acute; petals obovate, 4–6 mm long, yellow; stamens 20, anthers about 0.5–1 mm long; pistils numerous, style 1.5–2.5 mm long. **ACHENES** 1.7–2 mm long. [*P. concinna* var. *bicrenata* (Rydb.) S. L. Welsh & B. C. Johnston]. Ponderosa pine and sagebrush communities. ARIZ: Apa; NMEX: SJn; UTAH. 2065–2805 m (6775–9200'). Flowering: May–Jun. Eastern Utah, northeastern Arizona, and northwestern New Mexico.

Potentilla concinna Richardson (elegant) Elegant cinquefoil. Perennial herb from a branched caudex. **STEMS** numerous, ascending in flower, prostrate in fruit, 0.5–3 dm long. **LEAVES** mostly basal, digitate, 5–7 (9)-foliolate, sometimes subpinnate, petiole mostly 1.5–3.5 cm long; leaflets 7–20 mm long, the terminal one longest, toothed to shallowly lobed, oblanceolate to obovate, often folded. **INFL** a 1–7-flowered cyme, divaricately branched, pedicels 0.5–2.5 cm long, often becoming recurved in fruit. **FLOWER** branchlets oblong-lanceolate, mostly 2.5–4 mm long, acute, obtuse, or rounded; sepals 3.5–5 mm long, acute; petals obovate to oblanceolate, 4–6.5 mm long, yellow; stamens 20, anthers 0.6–1 mm long; pistils numerous, style 1.3–2.5 mm long. **ACHENES** 1.7–2 mm long. $2n = 70$. Spruce-fir communities to alpine. COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn. 3210–3720 m (10540–12200'). Flowering: Jun–Aug. Alberta and Saskatchewan south through Montana and the Dakotas to eastern California, Nevada, Utah, Arizona, and Colorado. Within the Four Corners region this cinquefoil is one of the most common in the high mountains of Colorado.

Potentilla crinita A. Gray (long-haired) Bearded cinquefoil. Perennial herb; 2–5 dm tall from a branched caudex. **STEMS** ascending to erect. **LEAVES** strigose-sericeous, mostly basal, pinnate, mostly 11–13-foliolate, 4–20 cm long; leaflets oblanceolate to narrowly oblanceolate, 10–30 mm long, shallowly toothed beyond the middle or at the apex only, entire, the upper lateral pair decurrent on the rachis; cauline leaves few, reduced. **INFL** a divaricately branched cyme, strigose-sericeous. **FLOWER** bractlets lanceolate, 1.7–4.5 mm long, acute to obtuse; sepals lanceolate, mostly 4–6 mm long, acute or acuminate; petals oblanceolate, mostly 4.5–7.5 mm long, yellow; stamens 20, anthers about 0.5–1 mm long; pistils numerous, styles about 1.8–2.5 mm long. **ACHENES** 1.5–1.7 mm long, smooth to weakly rugulose. $2n = 84$. [*P. lemmoni* (S. Watson) Greene; *P. vallicola* Greene]. Meadows; piñon-juniper woodland, ponderosa pine, aspen, and Gambel's oak communities. ARIZ: Apa; COLO: Arc; NMEX: RAr, SJn. 2040–2680 m (6700–8800'). Flowering: Jun–Aug. Southern Utah and Nevada, southwestern Colorado, northeastern Arizona, and northwestern New Mexico. Used by the Ramah Navajo as a "life medicine."

Potentilla diversifolia Lehm. (many-shaped leaves) Mountain meadow cinquefoil, diverse-leaved cinquefoil. Perennial herb from a much-branched caudex. **STEMS** decumbent to ascending, 0.5–3 dm long. **LEAVES** mostly basal, digitate (rarely subpinnate), 5–7-foliolate, the petiole mostly 2–6 cm long; leaflets oblanceolate to obovate, 0.8–3 cm long, the terminal one usually the longest, cuneate, toothed in the distal 1/2, sparsely to densely sericeous, ciliate, or glabrate, greenish. **INFL** a many-flowered, open cyme, tomentose to villous. **FLOWER** bractlets lanceolate to ovate, mostly 2.5–4 mm long, obtuse; sepals ovate to deltate-lanceolate, 3.5–5.5 mm long, acute; petals oblanceolate to broadly obovate, 4.8–9 mm long, rounded, yellow; stamens 20, anthers 0.35–0.7 mm long; pistils numerous, style 1.4–2.3 mm long. **ACHENES** 1.2–1.6 mm long. $2n = 42–101$. Wet meadows, streamsides, lake margins; from subalpine to alpine communities. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NMEX: SJn. 3110–3840 m (10200–12600'). Flowering: Jun–Sep. British Columbia and Alberta south through eastern Oregon, Idaho, western Montana, Wyoming, to eastern California, Nevada, Utah, Arizona, Colorado, and New Mexico. Often hybridizes with *P. pulcherrima*.

Potentilla hippiana Lehm. (for Carl Frederick Hippio, a colleague of Lehmann) Woolly cinquefoil, Hippio's cinquefoil. Perennial herb from a branched caudex. **STEMS** 0.6–5 dm tall, ascending to erect, sericeous. **LEAVES** mostly basal, crowded, pinnate, 5–13-foliolate, 3–14 cm long; leaflets densely white-tomentose beneath, 12–40 mm long, the upper 3 the largest, oblanceolate, cuneate basally, rounded or acute apically, deeply cleft to nearly halfway to the midrib or less, the upper lateral pair decurrent on the rachis; cauline leaves few, ovate to lanceolate. **INFL** an open cyme, branches straight and ascending. **FLOWER** bractlets lanceolate, 2.5–5 mm long, acute; sepals lanceolate, 4–6.5 mm long, acuminate; petals obovate, 4–6.2 mm long, slightly longer than the sepals, yellow; stamens about 20, anthers 0.5–1 mm long; pistils numerous, style 1.7–2.3 mm long. **ACHENES** about 1.5 mm long, smooth. $2n = 42, 70, 77, 84, 98$. Meadows; ponderosa pine, Douglas-fir, aspen, and spruce-fir woodland communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Mon, SJn; NMEX: McK, SJn; UTAH. 2485–3330 m (8000–10930'). Flowering: Jun–Aug. British Columbia, Alberta,

Saskatchewan, south through Montana, Wyoming, the Dakotas, and Nebraska, south to Utah, northeast Arizona, Colorado, and New Mexico. Often hybridizes with *P. pulcherrima*. Used as a lotion for burns, applied to sores caused by a bear, and to expedite childbirth by the Kayenta Navajo. Used by the Ramah Navajo as a poultice for injuries and as a "life medicine."

Potentilla nivea L. (of the snow) Snow cinquefoil. Mat-forming perennial herb from a much-branched, dark caudex. **STEMS** arachnoid-lanate or spreading-hirsute, decumbent to ascending, 0.2–2.5 dm long. **LEAVES** green above, white-tomentose below, mostly basal, 3-foliolate; petiole 0.7–6.5 cm long; leaflets obovate to flabellate, 5–15 mm long, terminal leaflet larger than the lateral pair, coarsely toothed; cauline leaves reduced. **INFL** a 1- to few-flowered cyme, divaricately branched. **FLOWER** bractlets lanceolate, 4–6 mm long; petals obovate, 4–5.5 mm long, yellow; stamens about 20, anthers 0.5–0.7 mm long; pistils numerous, style 0.8–1.1 mm long, thickened at the base. **ACHENES** about 1.5 mm long, smooth. $2n = 14, 28, 54, 56, 63, 70$. [*P. nipharga* Rydb.] Rocky slopes and ridges, alpine communities. COLO: Arc, Hin, Min, SJn. 3535–3900 m (11600–12800'). Flowering late June–Aug. Alaska to Quebec, south through the Rocky Mountains to Utah, Colorado, and northern Arizona.

Potentilla norvegica L. (of Norway) Norwegian cinquefoil. Erect annual, biennial, or short-lived perennial herb, 1–7 dm tall, from a slender taproot; herbage hirsute with stiff spreading hairs. **STEMS** leafy, few to several, usually branched in the upper part. **LEAVES** mostly cauline, reduced upward, 3-foliolate, petiole up to 6 cm long; leaflets oblanceolate to obovate, 1.5–4 cm long, shallowly lobed to toothed or coarsely serrate, the terminal leaflet longer than the lateral pair. **INFL** a leafy cyme; flowers inconspicuous. **FLOWER** bractlets broadly lanceolate, 3–7 mm long, acute to obtuse; sepals 3.5–8.5 mm long; petals mostly shorter than the sepals, broadly obovoid, 2–4 mm long, yellow; stamens 15–20, anthers 0.3–0.5 mm long; pistils numerous, style 0.7–0.8 mm long, thickened below the middle, subterminally attached. **ACHENES** 0.8–1.1 mm long, often becoming rugulose at maturity, brown. $2n = 42, 56, 63, 70$. Lakeshores, irrigation ditches, meadows, and other moist sites. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAt, SJn; UTAH. 1920–2715 m (6300–8905'). Throughout most of North America, Europe and Asia. The Ramah Navajo made a cold infusion of the whole plant for pain and fumes from the plant were used for sexual infection.

Potentilla ovina Macoun ex J. M. Macoun (of sheep) Sheep cinquefoil. Mat-forming perennial herb from a much-branched elongate caudex; herbage pubescent. **STEMS** decumbent, 0.5–2.5 dm long, usually several clustered, sericeous-hirsute. **LEAVES** mostly basal, 2–14 cm long, crowded, pinnate with linear segments, the upper leaflet sometimes decurrent, sericeous-strigose; cauline leaves few. **INFL** a 3–7 divaricately branched cyme; pedicels 0.5–4 cm long, more or less straight, spreading to ascending in fruit. **FLOWER** bractlets lanceolate, mostly 2.5–3.5 mm long, obtuse to rounded; sepals lanceolate, 3.5–5.2 mm long, acute to acuminate; petals obovate, 4–6 mm long, yellow; stamens 15–20, anthers 0.5–0.8 mm long; pistils numerous on a conical receptacle, style 1.8–2.5 mm long. **ACHENES** 1.5–2 mm long, smooth. [*P. diversifolia* Lehm. var. *pinnatisecta* S. Watson] Rocky slopes and ridges, alpine communities. COLO: LPl, Mon. 3505–3655 m (11500–12000'). Flowering: late Jun–Aug. Our material belongs to **var. *decurrens*** (S. Watson) S. L. Welsh & B. C. Johnst. (running down). In the Four Corners region, sheep cinquefoil is known only from the La Plata Mountains.

Potentilla paradoxa Nutt. (not of the expected) Contrary cinquefoil. Annual or short-lived perennial herb from a slender taproot; herbage villous-hirsute with spreading hairs. **STEMS** leafy, spreading to ascending, 1–5 dm long, often branched in the upper part, divaricate. **LEAVES** mostly cauline, reduced upward, pinnate, 5–9-foliolate, 4–10 cm long including the petiole; leaflets lanceolate to ovate, 10–27 mm long, the terminal leaflet usually longer. **INFL** a divaricately branched cyme. **FLOWER** bractlets lance-elliptic, mostly 2.5–4.5 mm long; sepals deltate-ovate, 2.8–6 mm long, acute; petals obovate, 2.5–3 mm long, yellow; stamens 20 or greater, anthers about 0.35–0.4 mm long; pistils numerous, style 0.5–0.6 mm long, thickened at the base. **ACHENES** 0.7–1 mm long, brown, rugose, with a protuberance on the ventral suture. $2n = 28$. [*P. supina* L. subsp. *paradoxa* (Nutt.) Soják] Shorelines along lakes and reservoirs. ARIZ: Apa, Nav; COLO: Arc; NMEX: SJn; UTAH. 1640–1890 m (5390–6195'). Flowering: Jun–Jul. Widespread in North America and Asia.

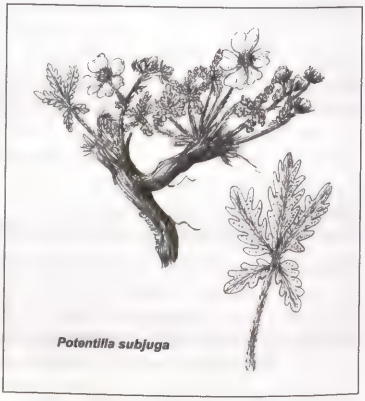
Potentilla pensylvanica L. (of Pennsylvania) Pennsylvania cinquefoil. Perennial herb from a branched caudex. **STEMS** few to several, erect to decumbent, 0.5–3 dm long, spreading-villous and substrigose, grayish green. **LEAVES** mostly basal, 5–15 cm long, with 2–6 (7) lateral pairs of leaflets, green, strigose above and grayish tomentulose beneath, pinnatifid, cleft halfway to the midrib, the lobes 2–5 mm long, rounded, margins revolute; cauline leaves few and small to well developed. **INFL** a several-flowered glomerate or open cyme; pedicels 5–20 mm long. **FLOWER** bractlets elliptic-lanceolate, mostly 3.5–4.5 mm long, rounded; sepals ovate, 3–6 mm long, obtuse; petals suberect, obovate, 3–6 mm long, pale yellow; stamens mostly 20, filaments yellow, anthers 0.5–0.8 mm long; pistils numerous, style 0.8–1.2 mm long, shorter than the achene, thickened at base, yellow. **ACHENES** 1.1–1.4 mm long. $2n = 28$. [*P. strigosa* (Pursh) Pall. ex Tratt.] Rocky

sites; ponderosa pine, black sage, aspen, and spruce-fir communities. ARIZ: Apa; NMEX: RAr, SJn; UTAH. 2255–3200 m (7400–10500'). Flowering: Jun–Sep. Alaska east to Hudson Bay, south to Arizona, New Mexico, and Mexico.

Potentilla pulcherrima Lehm. (beautiful) Beautiful cinquefoil. Perennial herb from a branched caudex. **STEMS** erect or ascending, 2–8 dm tall, sparsely to densely pubescent with spreading or appressed hairs. **LEAVES** mostly basal, digitate, 5–9-foliolate; petiole mostly 7–20 cm long; leaflets oblanceolate to obovate, mostly 2.5–6 cm long, the terminal one the largest; shallowly toothed to pinnatifid; leaflets green above and whitish lanate beneath. **INFL** a 2–3 (8)-flowered cyme; the pedicels 1.3–1.8 cm long. **FLOWER** bractlets 1.8–4 mm, lanceolate, acute; sepals deltate-lanceolate, mostly 2.6–5 mm long, acute; petals obovate to suborbicular, 4–6.5 mm long, yellow; stamens 20, anthers 0.6–0.9 mm long; pistils numerous, style 1.5–2.5 mm long. **ACHENES** 1.7–2.1 mm long. [*P. hippiana* Lehm. var. *pulcherrima* (Lehm.) S. Watson; *P. pulcherrimum* (Lehm.) Nieuwl.; *P. gracilis* Douglas ex Hook. var. *pulcherrima* (Lehm.) Fernald]. Moist meadows and open woods to alpine communities. COLO: Arc, Con, Dol, Hin, LPl, Min, Mon, RGr, SJn, SMg; NMEX: RAr; UTAH. 2135–3718 m (7000–12200'). Flowering: late May–Aug. British Columbia to Manitoba south to South Dakota, New Mexico, and Arizona. Hybridizes with *P. diversifolia*, *P. hippiana*, and *P. concinna.*

Potentilla rubricaulis Lehm. (red-stemmed) Red stem cinquefoil. Perennial herb from a dark brown caudex; vestiture often with a few small glandular hairs. **STEMS** decumbent to erect, 0.5–1.5 dm long, villous. **LEAVES** mostly basal, digitate, 5 (7)-foliolate, sometimes subpinnate; petiole 1–4 cm long, villous; leaflets 9–20 mm long, the terminal one the longest, obovate-cuneate, deeply pinnately divided, segments lanceolate, revolute-margined, green-sericeous above and densely white-tomentose beneath; upper cauline leaves 3-foliolate. **INFL** a 3–6-flowered, congested to open cyme; pedicels 2–10 mm long. **FLOWER** bractlets narrowly elliptic to narrowly lanceolate, mostly 2–3 mm long, obtuse; sepals lanceolate to ovate, 2.2–4 mm long, acute; petals 3–5 mm long, yellow; stamens 20, anthers 0.3–0.5 mm long; pistils numerous, style 0.7–1 mm long. **ACHENES** 1–1.2 mm long. $2n = 56$. [*P. dissecta* var. *rubricaulis* (Lehm.) Rydb.; *P. saximontana* Rydb.; *P. modesta* Rydb.; *P. paucijuga* Rydb.]. Rocky soils; alpine communities. COLO: SJn. 3840 m (12600'). Flowering: July–Aug. Known from one collection (*K. Heil 9142*) at Stony Pass summit. Alaska and Greenland, south to Nevada, Wyoming, Utah, and Colorado.

Potentilla subjuga Rydb. (somewhat paired) Perennial from a woody caudex. **STEMS** 1–3 dm tall, tufted, silky-villous. **LEAVES** digitate, (3) 5-foliolate with an additional smaller pair of leaflets on what appears to be the petiole; leaflets 1–4 cm long, oblong or oblanceolate to obovate, deeply incised, silky, denser below; cauline leaves reduced, trifoliate. **FLOWER** bractlets 1/4–1/3 shorter than the sepals; sepals 5–6 mm long, strigose; petals larger than the sepals, yellow; styles filiform, greater than 1.2 mm long. **ACHENES** glabrous. Alpine communities. COLO: Arc, Hin, SJn. 3570–3915 m (11715–12850'). Flowering: Jul–Aug. Wyoming, Colorado, and New Mexico.



Potentilla subjuga

Potentilla thurberi A. Gray (for George Thurber, botanist, naturalist, author, and editor) Thurber's cinquefoil. Perennial herb with horizontal rhizomes. **STEMS** 2–6 dm tall, erect or nearly so, sparsely villous. **LEAVES** palmate, with 5–7 leaflets, petioles up to 12 cm long; leaflets 1–5 cm long, oblong to oblanceolate, toothed. **FLOWER** bractlets 2–2.5 mm long; sepals villous, 4–5 mm long, acute; petals broad, longer than the sepals, dark red. Ponderosa pine communities. COLO: SJn. 2635–2680 m (8640–8800'). Flowering: Jul–Aug. Southern New Mexico and Arizona. Known from a single collection by Cyndie Holmes (*1683*) along the railroad between Durango and Silverton, Colorado. Probably an escape.

Prunus L. Cherry, Plum

(ancient Latin name of the plum) Deciduous (in ours) trees or shrubs, unarmed or with thorns. **STEMS** woody, bark often reddish, thin, smooth, with elongate horizontal lenticels. **LEAVES** simple, usually serrate, with prominent gland on petioles or base of blades; stipules small, caducous. **INFL** umbel, corymb, raceme, or flowers solitary; bracts small, caducous. **FLOWERS** perfect, white to pink, showy, large nectar disc present; hypanthium mostly cup-shaped, free from carpels, the ovary superior, usually circumscissile, deciduous; sepals 5, deciduous with the hypanthium; petals spreading, circular to elliptic, quickly falling; stamens usually 15–20; carpel 1, free from hypanthium, the ovary superior, style terminal. **FRUIT** a drupe, red to purple or black, rarely yellow; pits very hard, indehiscent, smooth or variously textured. $x = 8$. Perhaps 200 species of the north-temperate zone, but also the subtropics.

1. Inflorescence consisting of 15 or more flowers in an elongate raceme, a common native species ***P. virginiana***
1′ Inflorescence consisting of 15 or fewer flowers in a corymbose raceme, or umbel or solitary, a rare native or cultivated species ..... (2)

2. Inflorescence consisting of 3–15 flowers in a corymbose raceme, leaves finely crenate with a glandular hair in each sinus; native ..... ***P. emarginata***
2′ Inflorescence of a solitary flower or a few in an umbellate cluster, escaped, cultivated species ..... (3)

3. Drupe glabrous, neither furrowed nor glaucous, the stone (endocarp) globose or ovoid; cherries ..... ***P. avium***
3′ Drupe usually glaucous or pubescent, longitudinally furrowed, the stone compressed ..... (4)

4. Drupe glabrous, distinctly pedicellate, the pedicel usually remaining with the fruit at maturity; stone not prominently furrowed; plums ..... ***P. americana***
4′ Drupe pubescent; pedicel short to nearly absent, not falling with the fruit; stone usually prominently furrowed on the margin; apricots and peaches ..... (5)

5. Leaves (ob)ovate; sepals mostly glabrous; apricots ..... ***P. armeniaca***
5′ Leaves (ob)lanceolate to narrowly oblanceolate; sepals pubescent, at least on the margins ***P. persica***

Prunus americana Marshall (of America) American plum. Mostly shrubs, rarely treelike, to 5 m tall, glabrous. **LEAVES** up to 7 cm long, mostly 0.5–3 cm wide, elliptic to ovate or lanceolate, serrate, acuminate to a long-attenuate apex, acute to obtuse basally. **INFL** of 1–4 sessile or subsessile umbels, appearing before the leaves; pedicels up to 12 mm long. **FLOWER** hypanthium puberulent; sepals puberulent, spreading; petals white, 5–7 mm long, 2.5–3 mm wide. **FRUIT** a yellow to red plum, glabrous, distinctly pedicellate. Cultivated and escaped. ARIZ: Apa. COLO: Mon. NMEX: RAr, SJn. 1770–2080 m (5810–6820′). Flowering: late Apr–Jun. Widespread throughout North America. Cultivated by many southwestern tribes.

Prunus armeniaca L. (Armenian, apricot-colored) Apricot. Small trees up to 8 m tall; branchlets green to brown. **LEAVES** with blades 1.5–7 cm long, 1–6 cm wide, cordate-ovate to (ob)ovate, serrate, attenuate, obtuse to cordate basally, glabrous. **INFL** a solitary flower, appearing before the leaves; pedicel short. **FLOWER** hypanthium glabrous except basally; sepals glandular; petals white to pink, 8–12 mm long. **FRUIT** pubescent, fleshy; the stone longitudinally furrowed, compressed. Cultivated and escaped. ARIZ: Nav; NMEX: SJn. 1675–1830 m (5500–6000′). Flowering: late Apr–Jun. Widespread throughout North America.

Prunus avium (L.) L. (bird-attracting) Sweet cherry. Trees up to 8 m tall; branchlets brown. **LEAVES** with blades up to 15 cm long, 2.5–8 cm wide, oblanceolate to obovate, serrate or doubly serrate, attenuate, obtuse to rounded basally, glabrous to long-hairy. **INFL** of 2–4 flowers per bud, appearing with early leaves. **FLOWER** hypanthium glabrous; sepals glabrous; petals white to pink, 8–14 mm long. **FRUIT** glabrous, red to black, the stone globose or ovoid. Cultivated and escaped. ARIZ: Apa; NMEX: SJn. 1495–1700 m (4900–5575′). Flowering: Apr–May. Widespread throughout North America.

Prunus emarginata (Douglas ex Hook.) D. Dietr. (with a notched margin) Bitter cherry. Shrub up to 6 m tall, the branches erect to spreading, the young stems with smooth reddish bark; herbage glabrous. **LEAVES** in fascicles on short lateral branches or spread along elongating stems, petioles 1–10 mm long, occasionally with 1 or 2 glands near the summit, the stipules linear to lanceolate, deeply and finely lobed, the blade broadly oblanceolate to obovate, 1.7–4.5 cm long, 0.5–2.5 cm wide, cuneate basally, obtuse or usually rounded apically, finely crenate with a glandular hair in each sinus. **INFL** a 6–10 (12)-flowered corymbose raceme, on short lateral shoots, the pedicels 3–14 mm long. **FLOWER** hypanthium campanulate, 2–3.2 mm deep; sepals reflexed, ovate-rounded, 1.5–2.5 mm long; petals broadly (ob)ovate, 3–4.5 mm long, clawed, white; stamens about 20, the filaments 2.3–4.2 mm long, anthers 0.4–0.6 mm long; style deciduous, about as long as the filaments. **FRUIT** a drupe, 7–8 mm thick, bright red with pulpy exocarp, glabrous. [*Cerasus emarginata* Douglas]. Rocky slopes, often with aspen. ARIZ: Apa. 2745 m (9000′). Flowering: late-early Le. Our one record is from the Carrizo Mountains, about two miles south-southeast of Pastora Peak in a thick aspen grove (*Heil & Clifford 17663*). British Columbia to Idaho, south to California and Arizona.

Prunus persica (L.) Batsch (from Persia) Peach. Trees up to 4 m tall; branchlets green, aging to gray, glabrous. **LEAVES** with blades up to 15 cm long, 0.5–5.5 cm wide, oblong-lanceolate to narrowly (ob)lanceolate, serrate, attenuate, obtuse to acute basally, glabrous. **INFL** solitary, appearing before the leaves; the pedicel short. **FLOWER** sepals villous at the margin; petals white to pink, or red. **FRUIT** pubescent, fleshy at maturity; the stone usually furrowed on the margin, somewhat compressed. Cultivated and escaped. ARIZ: Apa; COLO: LPl. 1770–1995 m (5810–6540′). Flowering: late Apr–May. Widespread throughout North America.

Prunus virginiana L. **CP** (of Virginia) Western chokecherry, black chokecherry. Shrub or small tree up to 8 m tall, young stems puberulent, greenish at first, soon becoming glabrous, reddish, older stems ashy gray with a reddish brown undertone. **LEAVES** with petioles 1–2.5 cm long, with a pair of distal reddish glands, these glands sometimes on the blade near the base, stipules small, blade (ob)ovate or elliptic, 4–12 cm long, 1.5–4.5 (7.5) cm wide or usually smaller on the raceme-bearing branches, obtuse, rounded or subcordate basally, acute or acuminate apically, finely serrulate with ascending teeth, dark green above and pale green beneath, glabrous or with a few tufts of hairs in the axils of the lateral veins beneath, the midrib impressed above, prominent beneath. **INFL** an elongate raceme, 5–14 (20) cm long, with numerous flowers, the pedicels 2.5–7 mm long, each subtended by a bract, the lower flowers often in the axils of the upper leaves. **FLOWER** hypanthium 2–3 mm deep; sepals reflexed, broadly rounded or deltate, 0.6–1.3 (2) mm long, erose or usually fimbriate with reddish, glandular, clavate hairs; petals broadly ovate or suborbicular, 3–5 (6.5) mm long, white; stamens about 25, the filaments 2–5 mm long, the anthers 0.5–0.8 mm long. **FRUIT** 6–8 mm diameter, becoming dark red or bluish purple to nearly black. $2n = 16, 26, 32$. [*Cerasus demissa* Nutt. var. *melanocarpa* A. Nelson; *P. melanocarpa* (A. Nelson) Rydb.; *P. demissa* (Nutt.) D. Dietr. var. *melanocarpa* (A. Nelson) A. Nelson]. Along streams, canyon bottoms; sagebrush, piñon-juniper woodland, oak-serviceberry, ponderosa pine, and aspen communities. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1700–2895 m (5575–9500′). Flowering: May–Jun. Four Corners material belongs to **var. *melanocarpa*** (A. Nelson) Sarg. (black-fruited). British Columbia and Alberta south to eastern California, Nevada, Utah, Colorado, the Dakotas, Arizona, and New Mexico. The Ramah Navajo used a cold infusion of dried fruit for stomachache, an emetic in various ceremonies, and as a "life medicine"; the fruit was ground and made into small cakes or eaten fresh. The Navajo cooked the fruits into a gruel with cornmeal.

Purshia DC. ex Poiret Bitterbrush, Cliffrose

(for Frederick T. Pursh, Saxon explorer and plant collector) Fragrant shrubs or small trees, mostly deciduous. **STEMS** much-branched, woody, bark thin and gray to brown or shredding into long strips revealing orange underbark. **LEAVES** simple, pinnatifid or apically 3-lobed, coriaceous, crowded into fascicles terminating short shoots; stipules adnate to the leaf bases, forming a joint from which leaf blades dehisce, part below joint persistent. **INFL** of solitary flowers terminating short shoots; bracts small, persistent. **FLOWERS** mostly perfect, white to cream or yellow, fragrant, showy; hypanthium turbinate to funnelform, free from carpels, lined with nectar disc; sepals 5, epicalyx absent; petals 5, orbicular or spatulate, basally clawed, deciduous; stamens numerous; carpels 1–2 or 4–10, free from each other and the hypanthium, the ovaries superior, styles terminal, persistent. **FRUIT** an achene, either large with a short, nonplumose style or smaller with a long, plumose style. $x = 9$. About seven species and one hybrid taxon of western North America. The often-segregated genus *Cowania* is included here.

1. Carpels several; style long, plumose ..... ***P. stansburyana***
1′ Carpel 1 (2–3); style short, not plumose ..... ***P. tridentata***

Purshia stansburyana (Torr.) Henrickson **CP** (for Howard Stansbury, 1806–1863, explorer and naturalist) Cliffrose, cowania. Shrubs up to 7.5 m tall, with ascending branches, reddish brown bark becoming gray and exfoliating in age. **LEAVES** fasciculate on short lateral branches, revolute-margined, the larger ones 15 mm long, pinnately (3) 5–7-lobed, veins prominent beneath, green, finely pubescent along the midrib above, white-tomentose beneath, stipules persistent. **INFL** of solitary flowers terminating on short lateral branches; pedicels and hypanthium stipitate-glandular. **FLOWERS** fragrant, perfect or rarely staminate or pistillate; hypanthium narrowly obconic to narrowly campanulate, mostly 5–6 mm long, tapering into the pedicel; sepals ovate, 3–5 mm long, rounded, glabrate on the surface, tomentose on the margins; petals obovate to broadly oblanceolate or narrowly rhombic, 7–14 mm long, cuneate basally, rounded to obtuse apically, white, cream, or pale yellow; stamens numerous in 2 series, anthers 0.8–1 mm long; pistils 4–10, style elongating. **ACHENES** 4–12, narrowly turbinate, 5–7 mm long, glabrate at the base, densely pubescent toward the apex, mature style 2–4.5 cm long, densely plumose. $2n = 18$. [*Cowania stansburyana* Torr.; *C. mexicana* D. Don var. *stansburyana* (Torr.) Jeps.; *C. mexicana* var. *dubia* Brandegee; *C. alba* Goodd.; *C. davidsonii* Rydb.]. Rocky foothills, along washes and canyon bottoms; salt desert scrub, blackbrush, piñon-juniper woodland, and ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: Dol, Mon, SMg; NMEX: McK, San, SJn; UTAH. 1340–2135 m (4400–7000′). Flowering: May–Jun. Nevada and southeastern California, Utah, southwestern Colorado, northern Arizona, northwestern New Mexico; Mexico. *Purshia stansburyana* often hybridizes with *P. tridentata*. The Navajo used the plant for deer and livestock forage; pounded the leaves and stems and mixed with pounded juniper to make a brown or yellow-brown dye, and used inner bark for baby diapers. Used for arrows and dermatological aid by the Hopi. The Ramah Navajo used the leaves as an emetic in various ceremonies.

Purshia tridentata (Pursh) DC. (three-toothed) Bitterbrush, antelope bitterbrush. Shrub, upright or low and prostrate with trailing branches, gray bark. **LEAVES** fasciculate on short lateral branches, 10–23 mm long, cuneate, 3-lobed apically, margins revolute, veins impressed above and prominent beneath, blade thinly pubescent and green above and greenish white-tomentose beneath; stipules small, triangular, persistent. **INFL** of solitary flowers terminating on short, leafy branchlets; pedicels and hypanthium with stipitate-glandular hairs, tomentose. **FLOWERS** fragrant, perfect; hypanthium funnelform-turbinate, mostly 3–5.5 mm long, tapering into the pedicel; sepals ovate, 1.8–3 mm long, rounded or obtuse, lightly tomentose on the back; petals oblanceolate or obovate, 4–10 mm long, clawed, rounded apically, yellow; stamens about 25, anthers 0.9–1.5 mm long; pistils 1 (2). **ACHENES** 7–11 mm long, narrowly obovoid-fusiform, densely pubescent, leathery, style nonplumose. **SEEDS** 6–8 mm long, black. $2n = 18$. [*Tigarea tridentata* Pursh, *Kunzia tridentata* (Pursh) Spreng.]. Often in sandy soils; sagebrush, juniper, piñon-juniper woodland, and ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, Sln; UTAH: 1495–2300 m (4900–7550′). Flowering: late Apr–Jun. Southern British Columbia south to Washington, Oregon, and northeast California, east to western Montana, Wyoming, western Colorado, northern Arizona, and New Mexico, Black Hills of South Dakota. Navajo uses include gynecological aid (plant taken during confinement), considered as an important browse plant, bark used for diapers, and used to make arrows. Ramah Navajo used the leaves in various ceremonies, hunters chewed the leaves for "deer infection" and for good luck in hunting, and twig and leaf ash used for "Evilway" blackening.

Rosa L. Rose, Briar

Walter H. Lewis and Barbara Ertter

(ancient Latin *rosa* for the rose) Deciduous shrubs armed with prickles and/or aciculi, roots woody, "mostly rhizomatous turions," prickly. **STEMS** erect to spreading, climbing, or trailing, strict or branched, prickles straight, curved, or hooked, small and round to large, broad-based, and flat, often paired and infrastipular, aciculi mixed with prickles or alone on stolons and basally, upper stems and branches sometimes lacking armature. **LEAVES** alternate, petiolate, stipules conspicuous, paired, entire to pinnatifid, adnate along base of petiole and forming flared auricles apically, blade imparipinnate or rarely trifoliate, indument when present abaxially of simple hairs, sessile or stipitate glands, pricklets common to rachis and petiole; leaflets uniserrate or multiserrate, or a combination of both, often gland-tipped, short-petiolulate, longer for terminal leaflet. **INFL** a 1- to many-flowered determinate corymb or panicle, mostly bracteate. **FLOWERS** perfect, 5-merous, strongly perigynous, showy, often aromatic, borne at ends of lateral branches or occasionally main stems; hypanthium globose, oval, or urceolate, often constricting toward apex, constricted orifice, disc forming ring around opening; sepals (calyx lobes) 5, persistent or sometimes (in introduced *R. multiflora* in this *Flora*) deciduous, outer lobes sometimes toothed or pinnatifid, apices acute to long-attenuate or prolonged into foliaceous tips, outer surface eglandular or glandular, inner tomentose; petals 5, or by transformation of stamens numerous, light pink to deep rose, often fading with age, or white (*R. multiflora*), obovate or obcordate, apices usually emarginate, inserted on outer edge of disc; stamens numerous in several whorls inserted on disc, outer ones longer than inner, filaments slender, persistent, anthers small, yellow; pistils few or usually with many carpels inserted at base and/or inner walls of hypanthium, styles connate (*R. multiflora*) or free, included or long-exserted (*R. multiflora*), stigmas mostly capitate, grouped around the hypanthial orifice; ovaries hairy, few to mostly numerous, free, each with a single ovule. **FRUIT** accessory (hips), fleshy or pulpy, enlarged at maturity, usually red or orange, containing few or numerous bony achenes, seed coat thin, embryo filling the seed, radicle superior (Lewis 1959). *Rosa* consists of 100–150 species, primarily in north-temperate America and Eurasia, infrequently extending to subtropical areas. Widespread in Canada and the United States and occasionally northern Mexico, many species of Eurasian origin occur throughout the continent. In the *Flora* area we recognize four species, three indigenous and one introduced. Because of hybridization, polyploidy, and inherent diversity throughout widespread and multiple habitats, species boundaries are often obscured and their identities difficult to determine even using a well-constructed key. Subspecies are recognized for two indigenous species, *R. nutkana* and *R. woodsii*, the two most widely distributed and diverse species in western North America. Their subspecies are characterized by well-defined core features within ecogeographic patterns. Intermediate plants may occur where such zones coalesce within the overall distributional continuum of each of terns. Intermediate plants may occur where such zones coalesce within the overall distributional continuum of each species. Such plants can be treated as part of the subspecies they most closely approximate or identified only to the binomial level.

Fleshy or dried rose hips are a good source of digestible energy food for birds and other wildlife in the fall and winter when high crude protein food is scarce. Upper stems and leaves are also browsed by wildlife and livestock from spring to fall, and their protein content is sufficient to meet the maintenance requirements of sheep and cattle during the growing season. Native Americans have made extensive use of all parts of roses for food and therapeutic materials. In

addition to *R. multiflora*, other self-perpetuating naturalized roses could be anticipated in our area, particularly *R. canina* L. (rare in Utah), *R. eglanteria* L. (Utah, rare in New Mexico), and *R. rugosa* Thunb. (Utah). *Rosa foetida* Herrm. (Austrian briar rose) or hybrids (probably Harison's yellowrose, *R.* ×*harisonii* Rivers) with semidouble yellow, sometimes red-tinged, petals occur around current or abandoned dwellings as individual clumps or hedges, with totally abortive hips in the few maturing collections seen. No example of the species or hybrid(s) naturalizing and reproducing has been found in our area. Tradition has it that such plants were carried across the plains by Mormon pioneers (Cronquist et al. 1997b), and another tradition takes the rose to Texas, where it gained the appellation Yellow Rose of Texas. The hybrid ×*harisonii* (possibly *R. foetida* Herrm. × *R. spinosissima* L.) originated in 1830 in the New York City garden of attorney and amateur rose grower George Harison.

1. Stems arching and sprawling to 5 m long, forming dense, impenetrable clumps; petals white, very small (7–10 mm long); sepals deciduous, styles connate and exserted beyond the hypanthium (hip); introduced species, rare ..... ***R. multiflora***

1′ Stems upright, short to infrequently 3 m long; petals pink to rose, petals greater than 10 mm; sepals persistent; styles free and ± inserted in the hypanthium (hip); native species ..... (2)

2. Prickles common, various, usually straight and/or curved (plants occasionally unarmed but not with the combination of characters below); leaflets obovate to elliptic; flowers small, 30–35 mm across; sepals at base ± 2 mm wide; hips commonly small, less than 10 mm wide ..... ***R. woodsii***

2′ Prickles either straight, dense, needlelike aciculi to stem apex or straight to curved, broad-based, paired infrastipular prickles, rarely unarmed; leaflets elliptic and often large; flowers large, (35–) 40–60 mm across; sepals at base 2.5–4 mm wide; hips large, greater than 10 mm wide ..... (3)

3. Stems ± slender and flexible, armed with dense, straight, fine aciculi to apex; outer surface of sepals typically stipitate-glandular; rare in our area ..... ***R. acicularis***

3′ Stems armed with stout, straight or curved/hooked, mostly paired infrastipular prickles, occasionally unarmed; outer surface of sepals eglandular, rarely glandular; frequent at high elevations ..... ***R. nutkana***

Rosa acicularis Lindl. (needlelike prickles or aciculi) Prickly rose. **STEMS** 1 m tall or commonly shorter, armed to apices of floral branches with aciculi or rarely with aciculi and small round prickles, occasionally with few bristles. **LEAVES** with stipules edged with few or numerous glands, flared auricle averaging 4.6 mm, blades (3–) 5–7-foliolate, leaflets elliptic to oval, large, 25–40 (–50) × 12–21 (–30) mm, abaxially mostly puberulent to pubescent, frequently slightly glandular, uniserrate or biserrate; petioles with or without pricklets, few or many stipitate glands, glabrous to pubescent. **INFL** solitary or rarely 2–3-flowered; pedicel 20–30 mm long, often curving as hip matures, eglandular or rarely with stalked glands. **FLOWERS** 35–50 mm across; hypanthium elliptic, globose to pyriform, often with a distinct neck, 2.5–4 mm across, eglandular; sepals persistent in fruit, 19 × 3 mm basally, often with flared tips, outer surfaces typically stipitate-glandular; petals pink to rose, obovate or obcordate, ± 20 × 20 mm; pistils with many carpels, styles free, included in hypanthium. **FRUIT** orange-red at maturity, elliptic, globose, or elongated with extended neck, 13–18+ × 9–12 mm, eglandular, sepals upright or lateral, many achenes. $2n = 42$, hexaploid. [*R. acicularis* var. *bourgeauiana* Crép.; *R. engelmannii* S. Watson; *R. sayi* Schwein.]. Edge of spruce forest communities. COLO: Min. 2900 m (9400′). Flowering unknown. Our material belongs to **subsp. *sayi*** (Schwein.) W. Lewis (for Thomas Say, 1787–1834, distinguished American zoologist of early 19th century) Say's or American prickly rose. Subspecies *sayi* occurs from eastern Siberia, Alaska, and northern Canada east to Quebec and south to West Virginia, in the prairies south to South Dakota, and westerly in the Rocky Mountains south to southeastern and tentatively south-central Colorado.

Rosa multiflora Thunb. (many-flowered) Japanese rose, multiflora rose. **STEMS** few to many, forming dense, impenetrable clumps reaching 10 m across, erect and arching to trailing or sprawling to 5 m long, 1.5–3 (–5) m tall, armed with stout, curved prickles. **LEAVES** with petioles finely puberulent to pubescent; stipules pinnatifid, stipitate-glandular or eglandular, blade (5–) 7–9 (–11)-foliolate, 10–35 × 8–20 mm, abaxially glabrous to usually pubescent. **INFL** few to usually many flowers in a conical corymb; pedicel short, 1–1.5 cm, with stipitate glands or eglandular; bracts narrow and long (5–9 mm), fimbriate, early-deciduous, resembling small, free stipules. **FLOWERS** small, 15–20 mm across; hypanthium small, 1–1.5 mm wide, orifice minute; sepals ± triangular, about 6 × 1.5–2 mm, shorter than petals, early-deciduous, pinnatifid, outer surfaces glabrous or stipitate-glandular; petals white, rarely pink, obovate, about 7–10 × 5–7 mm; styles connate above, exserted from hypanthial orifice. **FRUIT** small, ovoid to globose, less than 7 mm diameter, red indument, with few yellowish achenes ± 4 mm long, flattened. $2n = 14$. Infrequent in disturbed areas. NMEX: SJn. 1650 m (5400′). Flowering: May. Widely naturalized in North America from East Asia, particularly in the East,

Midwest, and Pacific Coast areas of Canada and the United States. Introduced into North America to establish dense hedges and fencerows and to serve as understock for budding roses in the large commercial rose industry, the species has spread rapidly by its stolons and achenes (up to 500,000 seeds per plant) to become a major weedy pest species. Plants invade pastures, reducing grazing areas, and can cause severe eye and skin irritations in cattle.

Rosa nutkana C. Presl (for the Nootka tribe of west-central Vancouver Island, British Columbia) Nootka rose. **STEMS** stout, few to many from base, much-branched, 0.5–3 m tall, prickly throughout or unarmed above; stout, broad-based infrastipular prickles with scattered prickles internodally, straight and/or curved to hooked. **LEAVES** with petioles 20–30 mm long, glabrous or pubescent, eglandular or glandular; pricklets common; stipules broad, 10–18 mm long, usually glandular-dentate, flared auricles 4–6 mm, blades 5–7 (–9)-foliolate; leaflets elliptic to oval, 25–35 × (6–) 15–20 mm, base ± rounded, apex ± obtuse, uniserrate blade or commonly biserrate or multiserrate with glandular teeth, abaxially glabrous or pubescent, eglandular or glandular. **INFL** solitary or few-flowered; pedicel 10–20 mm long, glabrous or glandular. **FLOWERS** large, to 50–60 mm across, flowering at ends of lateral branches; hypanthium globose or subglobose, 5–7 mm in diameter, glabrous or infrequently glandular-hispid to bristly; sepals persistent in fruit, 15–40 mm × 3–4 mm basally, often constricted in the middle and expanded distally, outer surfaces glabrous, eglandular or occasionally glandular-hispid to bristly; petals broadly obcordate, 20–30 × 20–35 mm, pink to deep rose; styles free, included in hypanthium. **FRUIT** large, 12–20 (–24) × 10–18 mm, subglobose, globose to pyriform, sometimes with neck, red to purplish, numerous large 6 × 4 mm achenes. $2n = 42$. Wooded regions or open areas from sea level to moderate or high mountainous elevations. Higher montane in aspen, fir, spruce, and or pine forests. COLO, Arc, LP, Mm, Mon, RGr, SJn; UTAH. 2600–3200 m (8450–10400'). Flowering: late Jun–Jul. Fruit: Jul–Aug–Sep. Coastal Alaska south to northern California inland from British Columbia to Montana, south and west to Colorado, northern New Mexico, and Utah. Three subspecies are recognized: subsp. *nutkana* from coastal Alaska to northern California [*R. aleutiensis* Crép.; *R. muriculata* Greene]; subsp. *macdougalii* (Holz.) Piper of the intermontane region from British Columbia to Nevada and Utah [*R. macdougalii* Holz.; *R. spaldingii* Crép. ex Rydb.]; and our material belongs to **subsp *melina*** (Greene) W. H. Lewis & Ertter [*R. melina* Greene] of north-central New Mexico, southwest and central Colorado, northern and southeast Utah, and south-central Idaho. It is distinguished from other subspecies by its high-elevation habitat, populations of compact shrubs with short stems, 0.3–1.3 m tall, having curved and/or hooked prickles, sometimes combined with straight prickles, or infrequently unarmed in upper branches, sepals with outer surfaces typically stipitate-glandular. An additional "nutkanoid" type with large, greatly elongated hips and lacking prickles in upper branches is tentatively placed here [*O'Kane Jr. et al.* (SJNM); 3200 m (9100')].

Rosa woodsii Lindl. (for Joseph Woods, 1776–1864, British botanist widely recognized for his *Synopsis of the British Species of Rosa*) Woods' rose. **STEMS** much-branched, from 2–3 dm to 3 (–4) m tall, usually forming thickets commonly with infrastipular prickles, differing from those of internodes where prickles are often dense, variable, and with a wide mostly straight, less frequently curved or hooked (subsp. *arizonica* and subsp. *manca*), occasionally unarmed; reddish brown to grayish bark with age. **LEAVES** with petioles glabrous or pubescent, eglandular or glandular, and often with pricklets; stipules 6–14 × 0.5–2 mm, often glandular-margined, auricles flared, 2–5 mm wide; blades 5–7 (–9)-foliolate; leaflets elliptic to oval or obovate, variable in size, 10–30 × 6–20 mm, sharply uniserrate, occasionally biserrate or multiserrate with gland tips, abaxial surface glabrous to pubescent, eglandular to glandular. **INFL** 1- to few-flowered or a corymb with 5–10+ flowers; pedicels 6–14 mm, glabrous, eglandular; sepals persistent in fruit, short and ovate or long with foliaceous tip, sometimes pinnatifid, 10–16 × about 2 mm basally, outer surfaces eglandular or less commonly glandular, glabrous to pubescent, margins usually pubescent, inner tomentose; petals obovate or obcordate, 20–25 × 9–17 mm, pink to deep rose; pistils with many carpels, styles free and included in hypanthium. **FRUIT** fleshy, subglobose, globose to urceolate, with or without neck, 7–12 × 7–10 mm, numerous small achenes about 4 × 2 mm. Flowering: May–early Aug. Fruit: Jul–Oct. Central Alaska and northern Canada to western Ontario, south to Iowa, Oklahoma, western Texas, and Arizona, northeast of the Cascade and Sierra Nevada mountains to eastern California and central British Columbia; the commonest species in our area represented by three subspecies. $2n = 14$. A fourth subspecies, *R. woodsii* subsp. *ultramontana* (S. Watson) Roy L. Taylor & MacBryde, occurs in the intermontane region north and west of our area. Used as a pink or light orange dye for wool by the Navajo.

1. Stems frequently tall, 1–2 (–3) m, not compact or highly branched, internodes long, prickles mostly curved/hooked; terminal leaflets mostly elliptic; low riparian and wetland areas, Southwest ..... **subsp. *arizonica***
1′ Stems short to infrequently tall, 0.2–1 (–2) m, compact and markedly branched shrubs, internodes short, prickles straight or curved/hooked; terminal leaflets (some to many) obovate; various habitats ..... 12.

2. Prickles straight; prairies, plains, to limited high montane regions, mostly central Rocky Mountains....**subsp. *woodsii***
2′ Prickles mostly curved/hooked; high montane regions, mostly southern Rocky Mountains.....**subsp. *manca***

subsp. *arizonica* (Rydb.) W. H. Lewis & Ertter (for the state of Arizona) Found along creeks and other riparian habitats. [*R. arizonica* Rydb.; R. *granulifera* Rydb.; *R. neomexicana* Cockerell]. ARIZ: Apa, Coc, Nav; COLO: Dol; NMEX: SJn; UTAH. 1560–2200 m (5400–7150′). Flowering: Jun–mid-Jul. Fruit: Jul–Oct. Southern Nevada, northern and central Arizona, western New Mexico, southern, central, and northeast Utah, southern Idaho, and southwest Colorado.

subsp. *manca* (Greene) W. H. Lewis & Ertter (for Mancos Canyon area of southwest Colorado) In montane meadows, hillsides, and other openings and edges of aspen groves and pine/spruce/fir forests [*R. manca* Greene]. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SMg, SJn; NMEX: McK, RAr, SJn; UTAH. 2350–3050+ m (7700–10000+′). Flowering: Jun–Jul. Fruit: late Jul–Sep. Western Wyoming, Colorado, eastern Utah, north-central and northeast Arizona, and northern New Mexico.

subsp. *woodsii* In prairies, high plains, to montane regions, often in wetland and riparian habitats. [*R. macounii* Greene; *R. maximiliani* Nees]. ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, SMg, SJn; NMEX: McK, RAr, San, SJn. 1600–3150 m (5300–10350′). Flowering: late May–early Aug. Fruit: Jul–Sep. Central North America from Alaska to Iowa and Oklahoma, extending through the Rocky Mountains from Montana to New Mexico and eastern Arizona.

Rubus L. Blackberry, Raspberry

(Latin name for some species of the genus; allied with *ruber*, red) Mostly erect to trailing shrubs or scramblers from rootstocks or creeping stems, usually abundantly armed with prickles, sometimes unarmed. **STEMS** mostly biennial, sterile first year's growth, primocanes, and fertile second-year stems, floricanes. **LEAVES** often different on primocanes and floricanes; simple and then palmately lobed or compound with 3–7 leaflets, the leaflets arranged palmately or pinnately; stipules linear, small to conspicuous, free or adnate to the base of the petiole, persistent or caducous. **INFL** simple or compound cymes, racemes, or panicles, or flowers solitary; bracts foliaceous to linear, caducous or persistent. **FLOWERS** perfect, white to pink or rose-purple, showy, nectar disc present; hypanthium short, saucer-shaped; sepals 5, spreading to ascending, persistent, epicalyx absent; petals 5, elliptic to spatulate or circular, deciduous; stamens many; carpels many, free from each other and from hypanthium, the ovaries superior, inserted on a conelike to nearly flat receptacle, styles terminal, often deciduous. **FRUIT** red to purple or black, an aggregate of many drupelets, drupelets fleshy or rarely nearly dry, falling individually or coalescent and falling from the receptacle or with it; pits small, hard, indehiscent, variously textured. $x = 7$. Perhaps 700 species found in most parts of the world, a notoriously difficult genus with apomictic complexes.

1. Leaves simple; stems unarmed .....(2)
1′ Leaves compound, 3–5-foliolate; stems armed with prickles.....(3)

2. Leaves 10–25 cm long; style glabrous; fruit fleshy, widespread throughout the Four Corners region .....***R. parviflorus***
2′ Leaves 2.7–8.5 cm long; style hairy; fruit more or less dry; entering our range in the southern Chuska Mountains .....***R. neomexicanus***

3. Prickles slender, mostly straight, narrow-based, terete to subterete, very numerous, present on the hypanthium and sepals; anthers 0.7–0.8 mm long; pedicels glandular-pubescent; fruit red; widespread .....***R. idaeus***
3′ Prickles stout, often hooked, broad-based, laterally flattened, not numerous, not on the flowers; anthers 0.4–0.6 mm long; pedicels finely villous, rarely with glandular hairs; fruit dark red to purple; Navajo Mountain region .....***R. leucodermis***

Rubus idaeus L. (from Mount Ida) American red raspberry, wild raspberry. Prickly shrub. **STEMS** up to 2 m long, bark yellow to yellowish brown, exfoliating; prickles numerous, slender, narrow-based, terete to subterete, straight or nearly so; present on stems, petioles, petiolules, and main leaf veins beneath, also in the inflorescence and the pedicels, hypanthium, and sepals; primocanes with 3- or 5-foliolate leaves, leaflets often lobed. **LEAVES** of the floricanes 3-foliolate, petiole 1.7–4.5 cm long, the terminal leaflet largest, lanceolate to ovate, 3–5 cm long, 1.5–3.2 cm wide, truncate to subcordate basally, rounded, acute, or usually acuminate apically, coarsely double-serrate, gray-tomentose beneath, green and sparsely pubescent to glabrate above. **INFL** a raceme, few-flowered thyrse, or 1 or 2 flowers in the leaf axils; pedicel, hypanthium, and sepals glandular-pubescent and with prickles. **FLOWER** sepals lanceolate-acuminate or caudate, 6–11 mm long, becoming reflexed; petals oblanceolate or spatulate, 3–7 mm long, white; stamens numerous,

filaments broad, flat, anthers 0.7–0.8 mm long; pistils numerous, style 2–4 mm long. **FRUIT** an aggregate (of weakly coherent drupelets), tomentulose, red, reticulate-pitted. $2n = 14$. [*R. strigosus* Michx. *R. melanolasius* Dieck. *Ratidaea strigosa* (Michx.) Greene subsp. *acalyphacea* Greene]. Moist slopes and canyon bottoms, ponderosa pine, Douglas-fir, white fir, and spruce-fir communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Mon, Sln; NMEX: RAr, Sln; UTAH: 1985–3309 m (6520–10850′). Flowering: Jun–early Aug. Circumboreal; from Alaska to Newfoundland south to Oregon, eastern Nevada, Arizona, New Mexico, east to North Carolina. North American plants belong to **var. *strigosus*** (Michx.) Maxim. (bristled).

Rubus leucodermis Douglas ex Torr. & A. Gray (white bark) Western black raspberry, whitebark raspberry, Prickly shrub. **STEMS** arched, 1–3 m long, bark yellowish at first, becoming reddish brown, often with a whitish bloom, primocanes green to yellow; floricanes purplish, prickles stout, on the stems, petioles, and some leaf veins, stems and petioles with a whitish bloom. **LEAVES** of primocanes 3- or 5-foliolate, the 5-foliolate ones with 3 petiolulate leaflets and 2 sessile; of floricanes 3-foliolate, petioles 2–5 cm long, terminal leaflet largest, lanceolate to ovate, 3–5 cm long, 1.5–4.5 cm wide, obtuse, truncate, or subcordate basally, acute or acuminate apically, sharp-serrate, double-serrate, sometimes lobed, whitish tomentose below, dark green and sparsely pubescent above. **INFL** a 2–7 (10)-flowered corymb, sometimes reduced to solitary flowers in the upper leaf axils; the pedicel, hypanthium, and sepals finely villous, scarcely if at all glandular; peduncle and pedicel with prickles. **FLOWER** sepals reflexed at anthesis, lanceolate-caudate, 5–9 mm long, to 12 mm in fruit; petals oblanceolate or spatulate, 5–6 mm long, white; stamens numerous, filaments flat, anthers 0.4–0.6 mm long; pistils numerous, styles glabrous. **FRUIT** an aggregate (of coherent drupelets), subglobose, to 12 mm diameter, drupelets densely tomentose basally, dark red to purple, reticulate-pitted. $2n = 14$. [*R. idaeus* L. var. *gracilipes* M. E. Jones]. Slopes, stream banks, and moist canyons. ARIZ: Coc; UTAH: 1895–2950 m (6090–9685′). Flowering Jun–Jul. British Columbia and Alberta south to Washington, western Montana, Arizona, and Utah (Navajo Mountain).

Rubus neomexicanus A. Gray (of New Mexico) New Mexico raspberry. Unarmed shrub, erect. **STEMS** up to 2 m tall, becoming woody, bark reddish or orange-brown. **LEAVES** simple, petiolate, stipules lanceolate, petiole 1.5–3.8 cm long, crisped-pubescent, the blade 2.7–8.5 cm long and about as wide, palmately 3-lobed, sometimes 5–7 lobes, cordate, double-serrate, lobes obtuse to rounded, green, sparsely pilose above, pale, soft pubescence below. **INFL** of 1 or 2 flowers in the leaf axils or terminating branches. **FLOWER** sepals attenuate or caudate, 5–22 mm long, sometimes glandular-pubescent; petals (8) 11–28 mm long, white; stamens numerous, anthers 0.5–1 mm long, pistils numerous, style short, hairy. **FRUIT** an aggregate, red, about 15 mm diameter, more or less dry. [*Oreobatus neomexicanus* (A. Gray) W. A. Weber]. Ours on rocky slopes in a ponderosa pine community. NMEX: McK, 2675 m (8775′). Flowering: Jun. Known from one collection at the southern end of the Chuska Mountains (*Heil 25419*). Southwestern and northeastern Nerw Mexico, southeastern Arizona, and southeastern Utah (Lake Powell).

Rubus parviflorus Nutt. (small-flowered) Thimbleberry. Unarmed shrub, erect, up to 3 m tall, gray, flaky bark; herbage glandular-pubescent. **LEAVES** simple, petiolate, stipules lanceolate; petiole 2–11 cm long, blade mostly 10–20 cm long and about as wide, palmately (3) 5 (7)-lobed, cordate, irregularly serrate, lobes obtuse or acute. **INFL** a (1) 2–4 (7)-flowered raceme. **FLOWERS** with 5 (6–7) sepals and petals; sepals ovate-caudate, 10–18 mm long, glandular-pubescent, villous; petals ovate to obovate, 8–20 mm long, white, sometimes pinkish-tinged, stamens numerous, anthers 0.8–1.1 mm long; pistils numerous, ovary pubescent, style glabrous, 1–1.5 mm long. **FRUIT** an aggregate (of coherent drupelets), thimble-shaped. $2n = 14$. [*R. nutkanus* Moc. ex Ser.; *R. parviflorus* var. *hypomalacus* Fernald]. Moist places, often near streams; ponderosa pine, Douglas-fir, white fir, and spruce-fir communities. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; NMEX: RAr, SJn; UTAH: 2150–3230 m (7050–10600′). Flowering: Jun–Aug. Alaska south throughout the mountain states to northern Mexico, east to Ontario and Michigan.

Sanguisorba L. Burnet

(Latin *sanguis*, blood, + *sorbere*, to absorb, referring to the use of *S. officinalis* as an astringent) Perennial or annual herbs. **STEMS** from taproots. **LEAVES** pinnately compound, basal and cauline, leaflets deeply dissected or toothed, stipules persistent, mostly adnate to bases of petioles, the apices expanded and dissected; those of basal leaves adnate to and partially sheathing stems. **INFL** compact to dense indeterminate heads or spikes, long-pedunculate; bracts small, usually 3 subtending each flower. **FLOWERS** perfect or imperfect and the plants then monoecious (or dioecious), green, reddish, or white, small; hypanthium urceolate, nectar ring at top; sepals 4, somewhat petaloid, persistent, epicalyx absent; petals absent; stamens 2–48; carpels 1 or 2, enclosed by but free from hypanthium, the ovaries superior, stigmas much-branched with filiform segments, reddish, showy. **FRUIT** accessory, of 1 or 2 achenes enclosed within hardened, dry, winged hypanthium. $x = 7$. About 18 species of the Northern Hemisphere.

Sanguisorba minor Scop. (smaller) Burnet. Garden burnet, small burnet. Perennial from a branched caudex. **STEMS** simple or branched above, up to 7 dm tall; herbage glabrous or sparsely pilose with moniliform hairs. **LEAVES** mostly basal, pinnate, basal and lower cauline leaves mostly 10–15 cm long, 11–21-foliolate, blade ovate to ovate-flabellate; leaflets 10–25 mm long, crenate-toothed, pinnately veined. **INFL** a globose to ovoid spike, 10–25 mm long, 7–12 mm thick. **FLOWERS** perfect or lower of staminate, upper of pistillate; bracts ovate, ciliate; hypanthium urceolate; sepals 4, 4–5 mm long, cuneate, mucronate, greenish brown, often red-tinged; petals none; stamens mostly 12, filaments long-filiform, anthers 0.5–0.9 mm long; pistils 2; fruiting hypanthium pyriform, 3–5 mm long. $2n = 28, 56$. [*Poterium sanguisorba* L.]. Disturbed sites, often in piñon-juniper woodland and sagebrush communities. COLO: Dol, LPl, Mon; NMEX: RAr, San, SJn; UTAH. 1890–2365 m (6200–7760'). Flowering: May–Jun. Scattered throughout the United States; native to Eurasia.

Sibbaldia L. Sibbaldia

(for Sir Robert Sibbald, a Scottish physician and a founder of the Royal Botanic Garden, Edinburgh) Low, perennial herbs, forming mats or cushions. **STEMS** arising from a branched caudex covered in persistent leaf bases. **LEAVES** trifoliolate (in ours), with 3–5 apical teeth; stipules adnate to the bases of the petioles, forming a narrow wing. **INFL** few-flowered cyme, scapose, bracts small, persistent. **FLOWERS** perfect, yellow, small; hypanthium saucer-shaped, small, nectar disc present; sepals 5, alternating with 5 epicalyx lobes, persistent; petals 5, oblanceolate, much shorter than sepals, deciduous; stamens 5; carpels 5–10, free from each other and from the hypanthium, the ovaries superior, styles lateral. **FRUIT** an achene. $x = 7$. About 20 species, except for *S. procumbens* all Eurasian, mostly China to India.

Sibbaldia procumbens L. (prostrate) Creeping sibbaldia. Mat- or cushion-forming, rhizomatous, perennial herb; herbage appressed-pilose. **LEAVES** basal, 3-foliolate; leaflets 1–2.5 cm long, the terminal one slightly larger than the lateral pair, cuneate-obovate, (2) 3 (5)-toothed apically, teeth rounded, petiole 1–5.5 cm long; stem leaves smaller. **INFL** a few-flowered cyme, usually glandular-pubescent, strigose; pedicels 1–5 mm long. **FLOWER** hypanthium shallowly cupulate, mostly 2.2–3 mm across; bractlets linear to narrowly lanceolate, mostly 1.3–2.3 mm long; sepals broadly lanceolate to ovate, mostly 2.5–4 mm long; petals oblanceolate, 1.3–1.6 mm long, rounded to obtuse, pale yellow; stamens 5, anthers 0.3 mm long; pistils 5–15 (20). **ACHENES** 1.2–1.6 mm long, ovoid, smooth. $2n = 14$. [*Potentilla procumbens* (L.) Clairv.; *P. sibbaldia* Kurtz]. Rocky slopes and ridges; subalpine and alpine communities. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; UTAH. 3105–3890 m (10200–12760'). Flowering: mid-June–Aug. Circumpolar; south throughout the western United States to northern New Mexico.

Sorbus L. Mountain-ash

(ancient Latin name, perhaps for *S. aucuparia*) Deciduous, unarmed trees or shrubs. **STEMS** woody, bark smooth, lustrous, with elongated horizontal lenticels. **LEAVES** pinnately compound, leaflets usually serrate; stipules small, caducous. **INFL** large, convex, showy panicles; bracts small, caducous. **FLOWERS** perfect, white to cream, medium-sized, nectar ring present; hypanthium saucer-shaped, lower part fully adnate to hypanthium; sepals 5, reflexed at anthesis, persistent, epicalyx absent; petals ovate, elliptic, or obovate, clawed at base, spreading, deciduous; stamens mostly 20; carpels 3–5, incompletely connate, fully adnate to the hypanthium, styles fused at base. **FRUIT** a small, fleshy pome, red to orange (in ours), topped by persistent, incurved sepals. $x = 17$. In the strict sense, about 90 species of the north-temperate zone.

1. Rachis of leaf densely to sparsely white-hairy; leaflets 9–14, 18–45 mm long; Chuska Mountains ..... ***S. dumosa***
1' Rachis of leaf glabrous or sparsely pilose; leaflets 11–15, 40–75 mm long; widespread ..... ***S. scopulina***

Sorbus dumosa Greene (bushy) Arizona mountain-ash. Shrub, 1–5 m tall; slender branches, the young twigs more or less villous-pubescent, the stems becoming sparsely so; winter buds densely white-hairy. **LEAVES** 9–14-pinnate, 7–15 cm long, the rachis densely to sparsely white-hairy; leaflets 18–45 mm long, lanceolate, sharply serrate, rounded or cuneate at the base, acute or acuminate at the apex, green above, dull green below. **INFL** a corymb, 3–15 cm across, mostly 10–40-flowered, branches hairy. **FLOWER** sepals 1–2 mm long; petals oval, 5–6 mm long. **FRUIT** a globose pome, red at maturity. Moist sites in ponderosa pine and Douglas-fir communities. ARIZ: Apa; NMEX: SJn; UTAH. 2100–2800 m (6890–9185'). Flowering: late Jun–early Jul. Arizona and New Mexico.

Sorbus scopulina Greene (of rocks) Rocky Mountain ash. Shrub or small tree, 1–4 m tall, bark yellowish to reddish purple, becoming grayish red; herbage strigose-pilose, the stems becoming sparsely so, leaves becoming glabrate; winter buds glutinous brown, glossy, glabrous to sparsely whitish pubescent. **LEAVES** 11–15-pinnate, 14–21 cm long, the rachis grooved above and glandular-pubescent near the nodes, petiole 2–3.5 (4.5) cm long; leaflets broadly lanceolate

or elliptic, 4–7.5 (8.5) cm long, 1.5–2.5 cm wide, rounded to abruptly cuneate basally, acute or usually acuminate apically, finely serrate almost to the base, dark, glossy green above, dull, pale green and sparsely pubescent beneath. **INFL** a corymb, more or less flat-topped, 80–200-flowered, white appressed-pilose on the pedicels, hypanthium, and sepals. **FLOWERS** fragrant; sepals deltate, 0.7–1.8 mm long, acute or obtuse; petals obovate, 3–5 (6) mm long, white or cream; stamens 20, the filaments 2.5–4 mm long, anthers 0.5–0.7 mm long, styles 3 or 4. **FRUIT** a globose pome, 8–10 mm in diameter, bright glossy orange-red, drying purplish, of bitter taste. **SEEDS** oblong, 3.5–4 mm long, flattened, light brown. Mountain slopes; ponderosa pine, Douglas-fir, white fir, aspen, and spruce-fir communities. COLO Arc, Hin, LPl, Min, Mon, SJn. 2265–3220 m (7440–10565'). Flowering: late Jun–early Jul. Alaska, Yukon, south to British Columbia, western Alberta, Washington, Oregon, northern California, Idaho, western Montana, Wyoming, northeastern Nevada, Utah, northeastern Arizona, and New Mexico; Black Hills of South Dakota. Our material belongs to **var. *scopulina***

RUBIACEAE Juss. MADDER (COFFEE) FAMILY

Linda Mary Reeves

(Latin *rub*, red or reddish, referring to the flowers or fruit) Annual or perennial herbs, shrubs, vines, or trees. **LEAVES** entire, mostly opposite or appearing whorled due to presence of leaflike stipules, sometimes forming a sheath. **INFL** paniculate, cymose, headlike, clustered or solitary. **FLOWERS** actinomorphic, perfect, occasionally functionally imperfect; sepals generally 4–5, united, the lobes sometimes reduced or absent; petals generally 4–5, united, white, greenish, blue, purple, yellowish, pink, or red, often with striped markings; stamens epipetalous, alternate with corolla lobes; ovary inferior, 2–4-loculed, style often lobed. **FRUIT** 2–4 nutlets, berries, drupes, or schizocarps. About 450 genera with about 6500 species; worldwide, mostly tropical. Many important cultivated genera and species, including *Coffea arabica* (coffee), *Gardenia jasminoides* (gardenia), *Cinchona* spp. (quinine), *Ixora*, *Bouvardia*, *Pentas*, and other genera of ornamental note. The Asian genera *Myrmecodia* and *Hydnophytum* contain noted myrmecophyte species (Dempster 1995).

1. Ovules several in each carpel; fruit a capsule; flowers conspicuous, showy ..... ***Houstonia***
1' Ovule 1 per carpel; fruit a nutlet, mericarp, or berry; flowers small or inconspicuous ..... (2)

2. Leaves opposite ..... ***Kelloggia***
2' Leaves appearing whorled ..... ***Galium***

Galium L. Cleavers, Bedstraw

(Greek *gala*, milk, from use of *Galium verum* for curdling; the common name bedstraw from old use of vinelike plants with uncinate hairs to grip and bind up straw used for bedding) Annual or perennial herbs, small vines, subshrubs, or shrubs. **STEMS** squared in cross section. **LEAVES** generally opposite, but may appear whorled with presence of leaflike stipules. **INFL** a panicle or axillary cyme, often a subcyme of 3 flowers or solitary in leaf axils. **FLOWERS** perfect or imperfect; calyx absent; corolla usually rotate, sometimes campanulate or weakly tubular, usually white, cream, greenish to pink, or dark red, the petal lobes usually 4; style 1, deeply bifid. **FRUIT** a schizocarp of 2 nutlets, mericarps, or 2 berries; variously hirsute to glabrous. The fruits are critical in identifying the species. About 400 species worldwide, mostly from temperate regions. Two or more species often grow together in the same habitat and are often collected and mounted on the same herbarium sheet.

1. Fruit of 2 spherical, hard mericarps, black when mature, weakly joined; leaf apices rounded ..... ***G. trifidum***
1' Fruit various, but not as above; leaves not round at apex ..... (2)

2. Leaves generally, on a single plant, more than 4 per node ..... (3)
2' Leaves 4 or fewer per node ..... (4)

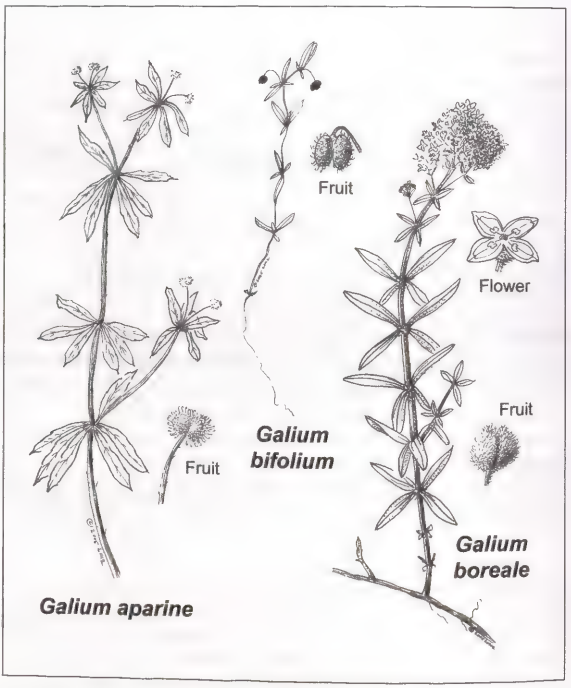
3. Perennial, generally prostrate; leaves narrowly to broadly ovoid, vanilla-scented; flowers white to cream ..... ***G. triflorum***
3' Annual, erect or climbing; leaves linear-spatulate or spatulate ..... (7)

4. All or some flowers imperfect; inflorescences narrow and diffuse; fruits with straight, straw-colored hairs ..... (5)
4' All flowers perfect; inflorescence/fruit variable ..... (6)

5. Plants dioecious; flowers white, cream, or pinkish ..... ***G. coloradoense***
5' Plants polygamous; inflorescence diffuse; flowers generally dark red, rarely pinkish or striped ..... ***G. wrightii***

6. Inflorescence large, with numerous somewhat congested, whitish flowers ..... *G. boreale*
6′ Inflorescence with solitary flower in leaf axil; pedicel long, reflexed ..... *G. bifolium*

7. Plants generally climbing; leaves linear-spatulate ..... *G. aparine*
7′ Plants erect or ascending; lower leaves spatulate ..... *G. proliferum*

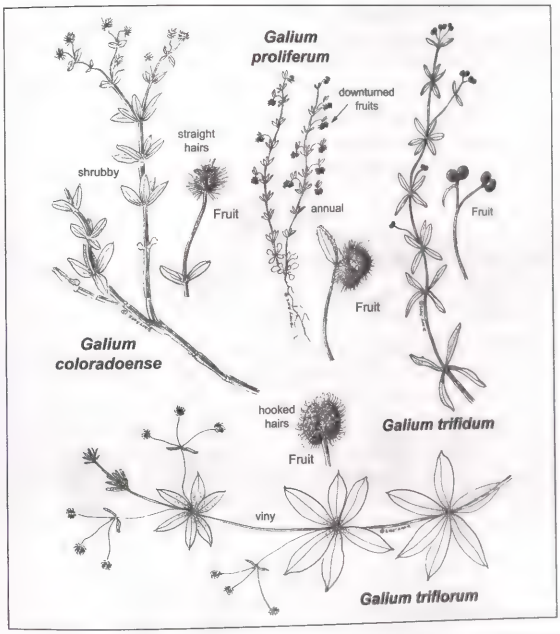


Galium aparine L. (old generic name meaning "to cling") Bedstraw, catchweed bedstraw, cleavers, cleaverwort, goose-grass, stickywilly. Clambering or prostrate annual, scabrous with prickly hairs. **STEMS** 10–90 cm or more long; nodes often tomentose. **LEAVES** 6–8 per node, ovate-spatulate to linear-oblanceolate, 13–31 mm long, bases narrow, apices mucronate, margins ciliate. **INFL** few-flowered on indeterminate lateral branchlets, 1–2 in a small cyme or solitary and axillary. **FLOWERS** perfect; corolla rotate, lobes obtuse or acute, white or yellowish, especially with age. **FRUIT** with short, uncinate, upturned hairs. $2n = 20$ (typical in our area), 22, 42, 44, 63, 64, 66, 86, 88. [*G. spurium* L.; *G. vaillantii* DC.]. Moist places in blackbrush, sagebrush, willow, piñon-juniper, aspen in shade or edges of forests; talus. Relatively uncommon in our area. COLO: Arc, Hin, Min, Mon; NMEX: SJn; UTAH. 1130–2600 m (3700–8400′). Flowering: Apr–Jun. Fruit: Jun–Jul. Western North America from southern British Columbia through the United States and Alaska. Possibly native to Europe.

Galium bifolium S. Watson (two-leaved) Low mountain bedstraw, twinleaf bedstraw. Erect, slender, glabrous annuals. **STEMS** 5–18 cm high. **LEAVES** lanceolate or narrowly elliptic, acute, mainly 4 per node, in unequal pairs, the upper leaves occasionally in pairs; the larger leaves 0.4–2 cm long. **FLOWERS** perfect; solitary in leaf axil; pedicel long, reflexed below the fruit; corolla 3-lobed, lobes glabrous, cleft about 2/3 of length, white, ascending, obtuse, shorter than ovaries. **FRUIT** with short uncinate hairs; mericarps nearly separate at maturity. Shaded slopes and meadows. Rare, but may be mixed and/or misidentified with other *Galium* collections. ARIZ: Apa; COLO: Mon; NMEX: SJn. 1700–2800 m (5500–9200′). Flowering: May–Jun. Fruit: Jun–Aug. Western North America from British Columbia and Montana to southern California, Arizona, and New Mexico.

Galium boreale L. (northern) Northern bedstraw. Erect perennial, 3–6 dm high, nearly glabrous. **LEAVES** 4 per node, 13–31 mm long, linear to broadly lanceolate, 3-veined, minutely scabrous, apex obtuse. **INFL** a congested, terminal, nearly leafless, more or less pyramidal panicle of cymules. **FLOWERS** perfect, numerous; corolla cream or white, sometimes with faint purplish markings which fade in dried specimens, rotate or a little cupped at base, the 4 lobes ovate, the apices blunt; ovaries generally densely hairy with short, upwardly curved hairs. **FRUIT** dry, with short bristles, the mericarps becoming reniform. $2n = 44$, 66. [*G. septentrionale* Roem. & Schult.; *G. utahense* Eastw.]. Sagebrush, meadows, aspen, spruce-fir, streamsides in moist shade. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, RGr; NMEX: RAr, SJn. 1770–3050 m (5800–10000′). Flowering: May–Sep. Fruit: Jul–Oct. Montane North America, east to Virginia, north to Maine; not in the southeastern United States; east Asia, Europe. One of our most common species of *Galium*. Plants from North America and east Asia are hexaploid ($2n = 66$), differing from those tetraploids of Europe and west Asia ($2n = 44$). Ours are **subsp. *septentrionale*** (Roem. & Schult.) H. Hara. Roots were used as a dye by Great Basin tribes.

Galium coloradoense W. F. Wright (of Colorado) Shrubby bedstraw, Colorado bedstraw. Plants perennial, mostly erect, sometimes shrubby, to 30 cm tall. **STEMS** slender, several from woody base, arising from creeping rhizomes, to about



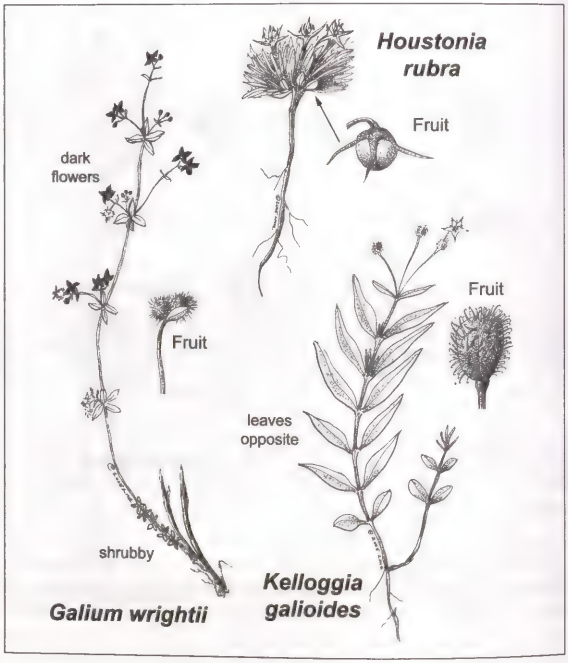
40 cm long, often woody and darker toward the base. **LEAVES** mostly 4 in whorl-like clusters, sessile, mostly linear to lanceolate, apex acute, often reflexed, 5–25 mm long, 2–3 mm wide, with prominent, often lighter midrib below, glabrous to scabrous. **INFL** small and few-flowered, borne on short axillary branches, occasionally larger and more congested. **FLOWERS** dioecious, pedicellate; corolla greenish yellow, inconspicuous, sometimes with purplish markings which fade in dried specimens, 2–4 mm wide, often scabrous-hispid externally. **FRUIT** with long, spreading, flattened, white or straw-colored hairs 1–3 mm long. $2n = 22$. [*G. multiflorum* Kellogg var. *coloradoense* (W. F. Wright) Cronquist]. Shaded, rocky or sandstone crevices and cliff locations in desert scrub, sagebrush, mountain brush, and piñon-juniper. Relatively common. ARIZ: Apa, Nav; COLO: Dol, LPl, Mon; NMEX: SJn; UTAH. 1460–3100 m (4800–10100′). Flowering: May–Aug. Fruit: May–Oct. Southern Wyoming, eastern Utah, western Colorado, northeastern Arizona, northwestern New Mexico. A highly variable species.

Galium proliferum A. Gray (bearing many offspring) Limestone bedstraw. Annual to 30 cm high, erect to stiffly ascending, glabrous to hairy. **LEAVES** mostly 4 per node; 3–9 mm long; the lower petiolate and spatulate; the upper more or less sessile, linear to obovate, more or less remote. **INFL** a small cyme with short branches at nodes or flowers solitary. **FLOWERS** perfect, minute; short-pedicelled; corolla tiny; lobes erect, apices rounded; white, often tipped with pink. **FRUIT** with 2 dark, kidney-shaped mericarps, downturned from 2 erect leaves; hairs long, straight or weakly uncinate. Damp locations near streambeds, washes, hanging gardens, or under shrubs. Uncommon. UTAH. 1620 m (5300′). Flowering: Mar–Jun. Fruit: Jun–Sep. Southern California east to Utah, Arizona, New Mexico, the Edwards Plateau and Trans-Pecos region of Texas, south through Baja California and Sonora, Mexico.

Galium trifidum L. (three-parted) Threepetal bedstraw. **STEMS** usually perennial, thin, lax; internodes widely spaced, 6–12 cm long; glabrous. **LEAVES** 2–6 per node, mostly 4, sessile, apex rounded, 4–12 mm long; linear to obovate; glabrous. **INFL** with 1–4 flowers, sometimes subtended with a minute bract or scale. **FLOWERS** perfect; pedicel slender, long; corolla rotate, white to greenish white, rarely striped with pink, generally 3-lobed, lobes ovate, ascending. **FRUIT** with 2 mericarps, spherical, glabrous or with a few short, flat hairs or scales, black or dark brown. $2n = 24$. [*G. brandegeei* A. Gray; *G. columbianum* Rydb.]. Margins of lakes, ponds, streams, mountain brush, ponderosa pine, spruce-fir. May be locally common at higher elevations. Often grows with or near *G. boreale*. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: SJn. 2470–3400 m (8100–11100′). Flowering: Jun–Jul. Fruit: Jun–Oct. Circumpolar, extending southward in North America along the Sierra Nevada and Rocky Mountains; Texas and Louisiana, east to Virginia. Our plants belong to **var. *pusillum*** A. Gray (very small).

Galium triflorum Michx. (three-flowered) Fragrant bedstraw, sweet-scented bedstraw. **STEMS** perennial, herbaceous, 10–50 cm long, decumbent or viny, growth radiating from a central rhizome or root. **LEAVES** generally 5–6 per node, 5–40 mm long, elliptic to ovate-obovate, base gradually narrowing, apex apiculate or mucronate, glabrous to scabrous. **INFL** 1–5-flowered, usually 3, pedicellate in axillary, open, often divaricate cymules with 2 subtending bracts. **FLOWERS** perfect; corolla rotate, cream-colored or greenish, ovary about as long as or longer than corolla. **FRUIT** covered with soft white, cream, or golden brown hooked hairs; mericarps dark-papillate or furrowed, curved. $2n = 22, 44, 66$. [*G. brachiatum* Pursh]. Shady forest floors or moist streamsides under brush, ponderosa pine, Douglas-fir, and aspen. A common species in our area. Often grows with or near *G. boreale*. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: RAr, SJn; UTAH. 1650–3290 m (5400–10800′). Flowering: May–Aug. Fruit: Jun–Sep. Circumboreal, all states including Alaska, and mountainous Mexico.

Galium wrightii A. Gray (for Charles Wright, noted botanist) Wright's bedstraw. Polygamous, erect, subshrubby perennials. **STEMS** suffrutescent, several to many, 5–50 cm high, glabrous to scabrous. **LEAVES** 4 per node, 2 often below flowers, 7–20 mm long, linear to oblanceolate with broad insertions, apex acute; glabrous, scabrous, or hispid, with hookless hairs. **INFL** diffuse, branchlets spreading. **FLOWERS** sometimes subtended by a single bract; corolla dark red to pink, rarely pale or striped, rotate, lobe tips slender, acute. Helpful to see flowers in this species. **FRUIT** often with reddish papillae, hairs few to many, long, straight. $2n = 22$. [*G. rothrockii* A. Gray]. Moist, semishady slopes under ponderosa pine, Douglas-fir, and aspen, hanging gardens, cliffs. Uncommon, but may be locally abundant. ARIZ: Apa; NMEX: SJn. 1980–3820 m (6500–9900'). Flowering: Jun–Sep. Fruit: Jul–Oct. Texas to California, Nevada, and Utah, south to Baja California, Coahuila, and Sonora, Mexico.



Houstonia L. Bluet

(for William Houston, who collected in tropical America) Small annual or perennial herbs. **STEMS** upright. **LEAVES** opposite, with interpetiolar stipules. **INFL** cymose or flowers solitary. **FLOWERS** perfect, calyx 4-lobed; corolla 4-lobed, funnelform or salverform; stamens 4; stigmas bifid. **FRUIT** a capsule, bilocular, inferior. **SEEDS** crateriform. Fifty species, United States and Canada to Mexico. Closely allied to the more tropical genus *Hedyotis*.

Houstonia rubra Cav. **CP** (red) Red bluet. Caespitose perennial with small woody taproots. **STEMS** 1–10 cm tall, slender. **LEAVES** linear to oblanceolate, 5–30 mm long, 0.5–4 mm wide, erect or ascending. **FLOWERS** usually 1 per node, sessile or with a short pedicel to 4 mm long, corolla 8–40 mm long, salverform, red or pink to purple or rarely, white; heterostylous. **FRUIT** 2–3.5 mm long, 2–5 mm wide, walls thick, on recurved pedicel. $2n = 22$. [*Hedyotis rubra* (Cav.) A. Gray; *Houstonia saxicola* Eastw.]. Blackbrush, rocky grassland, piñon-juniper, washes. ARIZ: Apa, Nav; UTAH. 1680–2650 m (5500–8700'). Flowering: Apr–Oct. Fruit: May–Oct. Texas to Utah, south to southern Mexico. Puebloan tribes used an infusion of the plant for sore eyes and stomach upsets. Navajos used a decoction of the plant for menstrual problems.

Kelloggia Torr. ex Benth. Kelloggia

(for Albert Kellogg, 19th-century California botanist) Perennial herbs. **LEAVES** opposite, with small interpetiolar stipules. **INFL** a loose terminal cyme. **FLOWERS** 4–5-merous; corolla funnelform; ovary 2-loculed, each with 1 ovule. **FRUIT** a schizocarp splitting into 2 mericarps. Two species, one from western North America, the other from China.

Kelloggia galioides Torr. (resembling *Galium*) Milk kelloggia. **STEMS** erect, several, 15–40 cm long. **LEAVES** opposite, fascicled, 19–38 mm long, lanceolate to narrowly ovate, minutely serrulate, apex acute; stipules hyaline, 0.5–2 mm long, lanceolate, bifid or erose. **INFL** few-flowered. **FLOWERS** with pedicel filiform, 6–25 mm long, swelling below the junction with flower, becoming divergent; calyx curved inward toward the corolla; corolla 4–8 mm long, pink or white, outer surface pubescent, inner surface with tufts of hairs, tube slender, lobes spreading. **FRUIT** obovoid, 3 mm long, covered with flat, transparent, hooked hairs. Moist slopes, under piñon-juniper, sagebrush, mountain brush, Douglas-fir, ponderosa pine, or in meadows. ARIZ: Apa; NMEX: McK, SJn (Falling Iron Cliffs); UTAH. 1770–2670 m (5800–8700'). Flowering: Jun–Sep. Fruit: July–Oct. Washington south to Baja California along the coast; Rocky Mountains from Montana south to Arizona and New Mexico.

RUPPIACEAE Horan. DITCH-GRASS FAMILY

C. Barre Hellquist

Annual, rarely perennial, submerged aquatic herbs usually of brackish or saline water. Rhizomes lacking. **LEAVES** alternate or subopposite, submersed, sessile, vein 1, blade linear. **INFL** terminal, capitate, with subtending spathe, pedunculate, peduncle following fertilization elongates and coils. **FLOWERS** bisexual, perianth absent, stamens 2, anthers distinct; pistils 4–16, stipitate. **FRUIT** drupaceous. **SEEDS** 1 (Fernald and Wiegand 1914; Haynes 1978). One genus with about 10 species worldwide.

Ruppia L. Ditch-grass, Widgeon-grass

(for German botanist Heinrich Bernhard Ruppius, 1688–1719) Herbs rooting at proximal nodes. **LEAVES** with blades minutely serrulate distally, apex obtuse to acute; vein 1. **FLOWERS** bisexual, anthers 2-loculed, stipe elongating after anthesis. **FRUIT** with long, stipitate beak. Two species in North America. Seeds have been made into a meal.

Ruppia cirrhosa (Petagna) Grande (with many tendrils, curls) **STEMS** 0.1–0.3 mm wide. **LEAVES** 3.2–45.1 cm, blade 0.2–0.5 mm wide. **INFL** peduncle with 5–30 coils, 30–300 × 0.5 mm. **FLOWERS** with pistils 4–6. **FRUIT** 1.5–2 × 1.1–1.5 mm; on a gynophore 2–5 cm; beak 0.5–1 mm. $2n = 40$ (in Europe). [*Buccaferrea cirrhosa* Petagna; *Ruppia cirrhosa* subsp. *occidentalis* (S. Watson) Á. Löve & D. Löve; *R. occidentalis* S. Watson]. Brackish waters, or waters of high sulfur and/or calcium content, in ditches, ponds, and lakes. COLO: Arc, Dol, SMg; NMEX: RAr, SJn. 1700–2270 m (5600–7500'). Alaska east to Yukon, Michigan, and Ohio south to California, Arizona, New Mexico, and Texas; West Indies; Central America; South America; and Europe. Flowering: Apr–Jul. The inland *R. cirrhosa* has recently been recognized as different from the coastal *R. maritima* L. and conspecific with the European plants.

SALICACEAE Mirb. WILLOW FAMILY

Robert D. Dorn

Trees or shrubs. **LEAVES** simple, alternate (rarely opposite), entire or toothed, rarely lobed. **INFL** a catkin. **FLOWERS** unisexual, the plants dioecious or very rarely monoecious; perianth none or vestigial, each flower subtended by a bract and/or cupular disc or 1 or 2 nectar glands; stamens (1) 2–80; pistil 1, this 2–4-carpellate; ovary superior, sessile or stipitate, locule 1, style 1 (rarely none), stigmas 2–4. **FRUIT** a 2–4-valved capsule. **SEEDS** usually many, comose (long-hairy for wind dispersal). $x = 19$. The only family of order Salicales, with two genera and about 480 species. Worldwide except for Antarctica, Australasia, and Malaysia, mostly in Arctic and temperate regions of the Northern Hemisphere. Most species are pioneers on newly created, open, moist habitats where there is little competition. Once established, they can persist for a long time. Proliferation of the introduced saltcedar (*Tamarix* spp.) and Russian olive (*Elaeagnus angustifolia*) has greatly reduced the possibilities for willow and cottonwood reproduction along most lower-elevation streams in the Four Corners region. Heavy grazing in some areas has also made seedling establishment difficult. Water diversions and pond construction since settlement have changed habitats, eliminating some but creating others.

1. Bud scales more than 1; bracts subtending flowers usually fringed (often deciduous); catkins mostly hanging downward; stamens 6–80; trees ..... ***Populus***
1′ Bud scale 1; bracts subtending flowers usually entire, rarely toothed or slightly lobed (sometimes deciduous); catkins mostly erect to spreading or drooping; stamens 2–8 (12); trees or shrubs ..... ***Salix***

Populus L. Cottonwood, Aspen, Poplar, T'iis (Navajo), Söhövi (Hopi), Sho-ap (Ute), Álamo (Spanish)

(the classical Latin name for poplar) Trees. Bud scales several, often resinous. **LEAVES** mostly toothed, rarely lobed. **INFL** a catkin, mostly pendulous. **FLOWERS** usually subtended by a fringed bract as well as a cup-shaped disc; stamens 6–80. **FRUIT** a 2–4-valved capsule (Eckenwalder 1977, 1992). About 30 species, mostly in the Northern Hemisphere, about a dozen in North America. Two species are commonly planted at lower elevations in the Four Corners region but are not known to escape cultivation. Carolina poplar (*P.* ×*canadensis* Moench) is similar to *P. deltoides*, but the leaves are not nearly so deltoid and have finer teeth and a more acuminate tip. Lombardy poplar (*P. nigra* L. var. *italica* Du Roi) has suberect branches forming a narrowly conical growth form. The leaves are similar to those of *P. deltoides* but not nearly so deltoid and with finer teeth. Additional hybrids are sold in the horticultural trade. Cottonwoods were put to many uses by native peoples including fire drills, tinder boxes, firewood, saddle frames, cradleboards, snowshoes, shovels, hoes, lances, prayer sticks, sweathouse frames, carved ceremonial figurines, dice, scrapers, awls,

bows, roof beams, loom frames, drums, and kachina dolls. Buds were used as chewing gum and food. Aspen was also used for some of these items. The inner bark, sap, and catkins were sometimes eaten.

1. Leaf blades white-tomentose on underside, margins coarsely toothed or lobed ..... ***P. alba***
1' Leaf blades usually glabrous or glabrate on underside, margins mostly toothed ..... (2)

2. Leaf blades suborbicular or cordate to deltoid; petioles strongly laterally flattened just below blade ..... (3)
2' Leaf blades mostly lanceolate or ovate; petioles usually not flattened ..... (5)

3. Leaf blades mostly suborbicular or cordate; bark smooth, whitish green to nearly white ..... ***P. tremuloides***
3' Leaf blades mostly deltoid or nearly so; bark rough, usually dark ..... (4)

4. Capsules ovoid, with saucer-shaped discs mostly 1.5–3.5 mm wide; young branchlets glabrous or sparsely hairy; blades of later-developing leaves often wider than long ..... ***P. deltoides***
4' Capsules mostly globose or ellipsoid, with cup-shaped discs mostly 3.5–9 mm wide; young branchlets often densely hairy; blades of later-developing leaves about as wide as long ..... ***P. fremontii***

5. Petioles mostly less than 1/3 the blade length; leaf blades mostly lanceolate or lance-ovate ..... ***P. angustifolia***
5' Petioles mostly over 1/3 the blade length; leaf blades mostly ovate ..... ***P. acuminata***

Populus acuminata Rydb. (narrowly pointed, referring to the leaf tip) Lanceleaf cottonwood. Tree to 25 m high, bark furrowed. **LEAVES** mostly ovate, crenate-serrate, the blades 5–9 (13) cm long, 3–7 cm wide. **CATKINS** 6.5–9 (16) cm long; stamens 25–40. **CAPSULES** 5–7 mm long, ovoid, 2- or 3-valved, stipes 1–2 (4) mm long. $2n = 38$. Stream banks, shores, and washes. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, SJn; UTAH. 1650–2600 m (5400–8500'). Flowering: May–Jun. Fruit: Jun. Alberta to western North Dakota south to northeast Arizona and Texas. Usually treated as a hybrid between *P. angustifolia* and *P. deltoides* but often occurring in the absence of one or both reputed parents. Probably better treated as a hybrid derived species.

Populus alba L. (white, referring to the tomentum of the leaves) Silver poplar. Tree to 30 m high, bark furrowed below. **LEAVES** ovate, undulate-toothed to deeply 3–5-lobed, usually white-tomentose on underside, the blades 3–5 (7) cm long, 2–4 (6) cm wide. **CATKINS** 2–9 cm long; stamens 6–10. **CAPSULES** 2–5 mm long, ovoid, 2- or 3-valved, stipes 0.5–1 (2) mm long. $2n = 38, 57$. Introduced from Europe and occasionally becoming naturalized, mostly along roadsides. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon; NMEX: McK, SJn; UTAH. 1550–2000 m (5100–6600'). Flowering: May–Jun. Fruit: Jun.

Populus angustifolia E. James (narrow leaf) Narrowleaf cottonwood. Tree to 20 m high, bark furrowed. **LEAVES** lanceolate to ovate, finely crenate-serrate, the blades 2–7 (10) cm long, 0.8–2.5 (4) cm wide. **CATKINS** 3–8 cm long; stamens 10–20. **CAPSULES** 3–8 mm long, ovoid or orbiculoid, 2-valved, stipes 0.5–1.5 (3) mm long. $2n = 38$. Stream banks, seeps, and mountain slopes. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, RGr, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1550–2950 m (5100–9700'). Flowering: May–Jun. Fruit: Jun–Jul. Southern Alberta south to central Chihuahua and northwest Coahuila, mostly in or along the western cordillera.

Populus deltoides W. Bartram ex Marshall (Greek *delta*, triangle, + *oides*, resembling) Cottonwood. Tree to 20 m high, bark deeply furrowed; branchlets glabrous or nearly so. **LEAVES** deltoid to deltoid-ovate, coarsely toothed to almost lobed, the blades 3–8 cm long, usually slightly wider, acute to short-acuminate. **CATKINS** 5–13 (21) cm long. Stamens 50–80. **CAPSULES** (4) 8–16 mm long, ovoid, 3- or 4-valved, floral disc 1–3.5 (4) mm wide, saucer-shaped (shallowly cup-shaped), stipes (1) 5–15 mm long. $2n = 38$. Stream banks, shores, and washes. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1150–2150 m (3800–7100'). Flowering: Apr–Jun. Fruit: May–Jun. Southwest Alberta to southern Quebec south to northern Chihuahua and Florida. Our plants are **var. *wislizeni*** (S. Watson) Dorn (for Friedrich Adolph Wislizenus, 1810–1889, a St. Louis physician who collected the variety in New Mexico). This is the variety from northeast Utah to south-central Wyoming south to northern Chihuahua and southwest Texas. Basin cottonwood.

Populus fremontii S. Watson (for John Charles Frémont, 1813–1890, army officer and western explorer who collected the species in California) Fremont cottonwood. Tree to 30 m high, bark deeply furrowed; year-old branchlets mostly pubescent. **LEAVES** deltoid or deltoid-cordate (deltoid-ovate), mostly coarsely round-toothed to almost lobed, the blades (4) 5–11 (14) cm long and about as wide, acute to short-acuminate (long-acuminate). **CATKINS** 4–13 cm long; stamens 30–70; floral disc 3.5–9 mm wide, deeply cup-shaped, stipes about (1) 3–4 mm long. **CAPSULES** 6–10 mm

long, globose or ellipsoid (ovoid), usually (3) 4-valved, $2n = 38$. Stream banks, shores, and washes. UTAH. 1150–1250 m (3800–4100'). Flowering: Apr–May. Fruit: May–Jun. Our plants are **var *fremontii*** the variety from northern California to northern Utah south to Baja California Sur and central Sonora. Another variety extends south to the Valley of Mexico. Presence of this species in the study area needs to be confirmed with a pistillate collection. There is some apparent intergrading with *P. deltoides*.

Populus tremuloides Michx. (referring to the "trembling" or "quaking" of the leaves in the slightest breeze) Quaking aspen. Tree to 30 m high but usually to 1/2 that, forming clones; bark mostly smooth and whitish green to nearly white. **LEAVES** cordate (ovate) to suborbicular, finely crenate-serrate; the blades 2–7 cm long and about as wide. **CATKINS** 2–10 cm long; stamens 6–12. **CAPSULES** 4–7 mm long, lanceoloid, 2-valved; stipes 1–2 mm long. $2n = 38, 57, 76$. Moist areas in the mountains and in steep shaded canyons at lower elevations. ARIZ: Apa, Nav, COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, San, SJn; UTAH: 1900–3250 m (6200–10700'). Flowering: May–Jun. Fruit: Jun–Jul. Throughout much of temperate North America from within the Arctic Circle to the mountains of central Mexico.

Salix L. Willow, K'ai' (Navajo), Qahavi (Hopi), Kan-nab (Ute), Sauce (Spanish)

(the classical Latin name for willow) Trees (lower elevations) to shrubs to tiny, creeping Arctic-alpine subshrubs. Bud scales solitary, nonresinous. **LEAVES** entire or toothed, usually stipulate but the stipules often deciduous. **INFL** a mostly spreading or drooping to erect catkin, the catkins sessile or on floriferous branchlets (peduncles) that are usually leafy. **FLOWERS** subtended by an entire or rarely toothed to erose bract and 1 or 2 nectaries; stamens (1) 2–8 (12). **FRUIT** a 2-valved capsule (Argus 1995, 1997; Dorn 1995, 1997, 1998, 2000). About 450 species worldwide but lacking from Antarctica, Australasia, and Malaysia, only one species from South America, nearly 100 in North America. Two species are often planted at lower elevations in the Four Corners region but are not known to escape cultivation: *S. babylonica* L., the weeping willow, is a tree with long, pendulous branches and lance-linear or narrowly lanceolate, glaucous leaves; *S. matsudana* Koidz., the globe willow (cultivar 'Umbraculifera'), is a small tree with a graceful, spherical crown and narrowly lanceolate, glaucous leaves. Except for growth form, the two are very similar and some authors consider them the same species. *Salix alba* L. var. *vitellina* (L.) Stokes has been sparingly planted, as along Chinle Wash at Many Farms, Apache County, Arizona. It differs from *S. babylonica* in having shorter, somewhat drooping branchlets rather than long, pendent branchlets, broader leaves, and the pistillate floral bracts are deciduous in fruit rather than persistent. It is separated from *S. fragilis* by its persistently pubescent leaves and shorter styles to 0.2 mm long. The specimens of *S. exilifolia* Dorn (*S. taxifolia* Humb., Bonpl. & Kunth) reported from San Juan County, New Mexico, were actually collected in Cochise County, Arizona. The use of willows by native peoples is not well documented by species, probably due to confusion of identity. The coyote willow, *S. exigua*, is the species most mentioned, likely because of its abundance and wide distribution at lower elevations. It is also one of the more easily identifiable willows. Navajos have used it in the ceremonials of the Lightning Way and Big Star Way as a medicine and tobacco. In addition, the leaves were used for medicinal purposes by soaking in water and the liquid then used as an emetic. The wood was used for weaving sticks and arrow shafts. The wood was also used for firewood when foods were cooked in ashes. Ancestral Puebloans used the wood for textile loom anchors, rods to control the weaving rhythm, for finishing needles, bows, arrow points, pot rests, scrapers, basket weaving, and cradle parts. The Utes used the branches for snowshoe frames and the basketry covering on the cradleboard. Mats were also made from willow branches. Leaves and roots have been used to produce dyes. Medicinal teas brewed from willow bark have been used to treat upset stomachs, headaches, fevers, and inflammations. The active ingredient is likely salicylic acid, a derivative of which is the main ingredient of aspirin. Other willow uses included prayer sticks, lances, and roof beams. Willow sticks were used for the Night Chant and Mountain Chant by the Diné (Navajo).

For best results in the following keys, avoid sucker shoots with vigorous growth, severely browsed shoots, young catkins, and leaves in early stages of development. *Salix arizonica* Dorn and *S. boothii* Dorn have both been collected within about 16 km of the study area in Conejos County, Colorado. These two species will key to *S. wolfii*, which has entire, persistently pubescent leaves rather than glandular-serrate (occasionally entire in *S. boothii*), glabrous or glabrate leaves when mature. The catkins of *S. wolfii* are generally shorter.

1. Vegetative material to be used for identification ..... **Vegetative Key**
1' Reproductive material to be used for identification ..... (2)
2. Reproductive material with female catkins ..... **Pistillate Key**
2' Reproductive material with male catkins ..... **Staminate Key**

Pistillate Key

1. Capsules hairy ..... (2)
1′ Capsules glabrous ..... (12)

2. Plants creeping shrubs 1–10 cm high with branchlets usually rooting, near or above timberline ..... (3)
2′ Plants erect shrubs or trees mostly well over 10 cm high, only occasionally above timberline ..... (4)

3. Peduncles prominent, usually without leaves; leaf tip usually rounded, the blade somewhat leathery and prominently reticulate-veined on underside; styles less than 0.5 mm long ..... ***S. reticulata***
3′ Peduncles usually leafy or very short; leaf tip usually pointed, the blade not leathery, venation reticulate but not especially prominent; styles 0.5–2 mm long ..... ***S. arctica***

4. Flower bracts yellowish, greenish, whitish, or tawny, deciduous in fruit; leaves linear to narrowly lanceolate or elliptic, nonglaucous ..... (5)
4′ Flower bracts only occasionally yellowish, greenish, whitish, or tawny, usually brown or black, persistent in fruit; leaves often broader, generally glaucous or glaucescent on underside ..... (6)

5. Petioles prominent, slender; bud scales split down the side toward branch with the free margins overlapping; leaves mostly finely serrulate ..... ***S. gooddingii***
5′ Petioles short and thick (rarely to 6 mm long) or lacking; bud scales caplike, not split down the side; leaves remotely denticulate or serrulate to entire ..... ***S. exigua***

6. Branchlets of previous year, and sometimes those of current season, glaucous, sometimes only apparent at nodes, especially behind buds ..... (7)
6′ Branchlets not glaucous ..... (8)

7. Catkins 15–60 mm long, sessile or nearly so, densely flowered; leaves often densely silver-hairy on underside, glabrous or glabrate on upper side; flower bracts usually dark ..... ***S. drummondiana***
7′ Catkins 6–20 (25) mm long, on leafy branchlets 1–18 mm long, loosely flowered; leaves sparsely to moderately sericeous on 1 or both sides; flower bracts tawny or light brown in fruit ..... ***S. geyeriana***

8. Stipes mostly 2–5 mm long; styles 0.4 mm or less long; flower bracts light brown or tawny; buds often with depressed margins ..... ***S. bebbiana***
8′ Stipes 2 mm or less long, or if as long as 3 mm, the styles often over 0.4 mm long; flower bracts tawny or dark; buds without depressed margins ..... (9)

9. Plants mostly to 1.5 m high; catkins appearing with the leaves on leafy branchlets 2–35 mm long; leaves and branchlets often conspicuously hairy ..... (10)
9′ Plants sometimes over 1.5 m high; catkins appearing before or with the leaves, sessile or nearly so or sometimes on branchlets to 13 mm long; leaves and branchlets often sparsely hairy to glabrous ..... (11)

10. Catkins 0.5–2 (3) cm long; stipes less than 0.5 mm long; expanded leaf blades 2–4 cm long, petioles mostly 1–3 mm long ..... ***S. brachycarpa***
10′ Catkins (2) 3–5 cm long; stipes 0.2–1.8 mm long; expanded leaf blades 3–8 cm long, petioles mostly over 3 mm long ..... ***S. glauca***

11. Stipes 0–1 mm long; leaves elliptic, usually very shiny on upper surface; year-old branchlets often reddish and shiny; stigmas usually less than 0.5 mm long; plants of wet places ..... ***S. planifolia***
11′ Stipes 0.8–2.8 mm long; leaves predominantly oblanceolate to obovate, not especially shiny; year-old branchlets mostly yellowish to reddish brown, dull; stigmas usually over 0.5 mm long; plants of drier upland areas ..... ***S. scouleriana***

12. Flower bracts yellowish, greenish, whitish, or tawny, deciduous in fruit; catkins on leafy floriferous branchlets; styles mostly less than 1 mm long ..... (13)
12′ Flower bracts often blackish or brown, persistent in fruit; catkins sessile or on leafy floriferous branchlets; styles 0.3–2 mm long ..... (19)

13. Bud scales split down the side toward branch, with the free margins overlapping; native trees at lower elevations ..... (14)
13′ Bud scales caplike, not split down the side; mostly shrubs or an introduced tree with very brittle branchlets ..... (16)

14. Leaves not glaucous on underside ..... ***S. gooddingii***
14′ Leaves glaucous on underside ..... (15)

15. Year-old branchlets mostly yellowish to grayish; branchlets of year mostly glabrous; later expanded leaves mostly lanceolate to ovate with acuminate tips ..... ***S. amygdaloides***
15′ Year-old branchlets mostly reddish, purplish, or brownish; branchlets of year sometimes hairy; later expanded leaves lanceolate to narrowly elliptic with mostly acute (acuminate) tips ..... ***S. bonplandiana***

16. Leaf blades predominantly linear to narrowly elliptic, remotely denticulate or serrulate to entire, usually hairy; petioles rather short and thick (rarely to 6 mm long) or lacking; catkins sometimes 2 to several in a terminal cluster in addition to lateral solitary catkins ..... ***S. exigua***
16′ Leaf blades predominantly lanceolate to ovate or broadly elliptic, mostly closely serrate or serrulate, often glabrous; petioles generally well developed and slender; catkins all lateral and solitary ..... (17)

17. Plants naturalized trees with very brittle branchlets that are easily broken off; catkins mostly slender and elongate, mostly 1 cm or less wide ..... ***S. fragilis***
17′ Plants native shrubs, the branchlets not especially brittle; catkins often thick and short, mostly 1 cm or more wide ..... (18)

18. Capsules mostly (6) 7–12 mm long when mature, somewhat shiny, maturing in phenological summer; catkins (1) 2–4 (5) cm long; leaves glabrous even when young (except first one emerging from the bud), stipules lacking or merely glands ..... ***S. serissima***
18′ Capsules mostly 7 mm or less long, usually dull, maturing in phenological spring; catkins 1.7–10 cm long; young leaves often hairy; stipules usually developed, occasionally deciduous, rarely reduced to glands ..... ***S. lasiandra***
S. wolfii

19. Leaves not glaucous on underside ..... (20)
19′ Leaves glaucous on underside (catkins sometimes appearing before the leaves) ..... ***S. irrorata***

20. Year-old branchlets glaucous (sometimes obscurely); flower bracts mostly obovate to suborbicular and densely fringed with long, relatively straight hairs; catkins mostly appearing before the leaves, sessile or on branchlets to 5 mm long; expanded leaves glabrous or essentially so ..... ***S. lasiolepis***
20′ Year-old branchlets not glaucous; flower bracts mostly narrower with often sparser, shorter, or curly hairs or glabrate; catkins appearing before or with the leaves, sessile or on branchlets to 17 mm long; expanded leaves glabrous or hairy ..... (21)

21. Flower bracts densely fringed with relatively straight, untangled hairs; catkins mostly appearing before the leaves, sessile or on branchlets to 7 mm long; typical buds short and plump, barely longer than wide; expanded leaf blades oblong, narrowly elliptic, or oblanceolate (obovate), usually hairy at least on underside ..... ***S. monticola***
21′ Flower bracts with often sparse hairs or with curly or tangled hairs; catkins appearing before or with the leaves, usually on prominent branchlets; buds often elongate; expanded leaf blades mostly lanceolate or elliptic to ovate (obovate or oblong), sometimes glabrous or glabrate ..... (22)

22. Styles averaging 0.7 mm or more long; leaf blades tending to be less than 3 times as long as wide; hairs of floral bracts long and straight or curly ..... ***S. eriocephala***
22′ Styles averaging 0.7 mm or less long; leaf blades tending to be over 3 times as long as wide; hairs of floral bracts crinkly and tangled mostly toward base of bract or sometimes bracts glabrate

Staminate Key

1. Stamens 3–8 per flower ..... (2)
1′ Stamens 2 per flower ..... (6)

2. Bud scales split down the side toward branch, with the free margins overlapping; catkins generally slender and lax; trees at lower elevations ..... (3)
2′ Bud scales caplike, not split down the side; catkins generally thick and stiff; shrubs ..... (5)

3. Leaves not glaucous ..... ***S. gooddingii***
3′ Leaves glaucous on underside ..... (4)

4. Year-old branchlets mostly yellowish to grayish; branchlets of current year mostly glabrous ..... ***S. amygdaloides***
4' Year-old branchlets mostly reddish, purplish, or brownish; branchlets of current year sometimes hairy ..... ***S. bonplandiana***

5. Leaves glabrous even when young (except first one emerging from the bud); stipules lacking or merely glands; catkins (1) 2–4 (5) cm long ..... ***S. serissima***
5' Leaves often hairy when young; stipules usually developed, occasionally deciduous, rarely reduced to glands; catkins 1.7–10 cm long ..... ***S. lasiandra***

6. Plants creeping shrubs to 10 cm high with branchlets usually rooting, near or above timberline ..... (7)
6' Plants upright trees or shrubs mostly well over 10 cm high, only occasionally above timberline ..... (8)

7. Catkins pseudoterminal opposite the terminal leaf, the prominent peduncle usually without leaves; leaves mostly oval to suborbicular ..... ***S. reticulata***
7' Catkins often borne laterally, the peduncle usually leafy or very short; leaves mostly elliptic ..... ***S. arctica***

8. Leaves glaucous on underside (catkins sometimes appearing before the leaves) ..... (9)
8' Leaves not glaucous ..... (20)

9. Year-old branchlets glaucous, sometimes apparent only behind buds, branchlets of current year sometimes also glaucous ..... (10)
9' Year-old branchlets and branchlets of current year not glaucous ..... (12)

10. Catkins mostly appearing with the leaves, on leafy branchlets; flower bracts mostly tawny or light brown ..... ***S. geyeriana***
10' Catkins appearing before the leaves, sessile or subsessile; flower bracts usually dark ..... (11)

11. Flower bracts mostly obovate (oblong), dark brown with rather dense, long, relatively straight hairs conspicuously exceeding bract tip; leaves soon becoming glabrous or nearly so ..... ***S. irrorata***
11' Flower bracts often narrower or darker or less hairy; leaves remaining mostly densely hairy on underside ..... ***S. drummondiana***

12. Plants naturalized trees with very brittle branchlets that are easily broken off; flower bracts yellowish, greenish, whitish, or tawny; expanded leaf blades mostly lance-elliptic or lanceolate and glabrous ..... ***S. fragilis***
12' Plants usually shrubs, the branchlets usually not very brittle; flower bracts often blackish or brownish, occasionally lighter; expanded leaf blades variously shaped ..... (13)

13. Flower bracts mostly brown to black, obovate to oval (oblong), densely fringed with straight, untangled hairs; leaves hairy at least on underside; typical buds mostly short and plump, barely longer than wide; anthers mostly 0.8 mm or less long; lowlands ..... ***S. lasiolepis***
13' Flower bracts sometimes lighter, mostly narrower or pointed at tip, with often sparse hairs or with curly or tangled hairs; leaves sometimes glabrous or glabrate; buds variable; anthers sometimes over 0.8 mm long ..... (14)

14. Nectaries generally 2 or more, both dorsal and ventral; expanded leaves mostly hairy; catkins coetaneous, terminating leafy branchlets; mostly high mountains ..... (15)
14' Nectaries generally 1, ventral; leaves sometimes glabrous or glabrate; catkins sometimes precocious or subprecocious and mostly sessile or subsessile; sometimes lower in mountains ..... (16)

15. Petioles mostly 1–3 mm long; catkins mostly less than twice as long as wide, 0.5–2 (3) cm long; expanded leaf blades 2–3 (4) cm long ..... ***S. brachycarpa***
15' Petioles mostly 3–16 mm long; catkins mostly over twice as long as wide, (2) 3–4 (5) cm long; expanded leaf blades generally 3–6 (8) cm long ..... ***S. glauca***

16. Young emerging leaves with some reddish hairs, especially on margins or at tip; flower bracts often with tawny hairs; mostly wet sites ..... ***S. planifolia***
16' Young emerging leaves with white hairs, or if with some reddish, then flower bracts with white hairs; sometimes in drier upland sites ..... (17)

17. Bracts at base of catkin densely fringed with long hairs, often tawny; filaments often 8 mm or more long; plants of drier uplands ..... ***S. scouleriana***

17' Bracts at base of catkin becoming greenish and glabrous or glabrate, at least at tip, rarely lacking; filaments rarely as much as 8 mm long; mostly wet sites ..... (18)

18. Flower bracts pale; buds generally with depressed margins; 2-year-old branchlets usually with cracked bark giving a white-streaking appearance ..... ***S. bebbiana***
18' Flower bracts usually dark but occasionally pale; buds without depressed margins; 2-year-old branchlets variable ..... (19)

19. Leaf blades tending to be less than 3 times as long as wide; flower bracts generally dark and prominent with long straight or curly hairs ..... ***S. monticola***
19' Leaf blades tending to be over 3 times as long as wide; flower bracts often brownish and inconspicuous with short tangled, crinkly hairs mostly toward base of bract or sometimes bracts glabrate (hairs on catkin rachis may be long and tangled) ..... ***S. eriocephala***

20. Flower bracts yellowish, whitish, greenish, or tawny; expanded leaf blades predominantly linear or linear-elliptic, remotely denticulate or serrulate to entire; catkins occasionally 2 to several in a terminal cluster in addition to lateral solitary catkins; petioles short and thick (rarely to 6 mm long) or none ..... ***S. exigua***
20' Flower bracts blackish or brownish; expanded leaf blades predominantly lanceolate, oblanceolate, or elliptic, entire; catkins all lateral and solitary; petioles mostly well developed and slender ..... ***S. wolfii***

Vegetative Key

1. Leaves glaucous on underside, or rarely underside much lighter from dense hairs that obscure leaf surface ..... (2)
1' Leaves not glaucous ..... (22)

2. Plants creeping shrubs to 10 cm high with usually rooting branchlets, near or above timberline ..... (3)
2' Plants upright trees or shrubs usually well over 10 cm high, only occasionally above timberline ..... (4)

3. Leaf blades predominantly oval to suborbicular with prominent reticulate venation on underside ..... ***S. reticulata***
3' Leaf blades predominantly elliptic with reticulate venation not especially prominent ..... ***S. arctica***

4. Bud scales split down the side toward branch, with the free margins overlapping; native lowland trees ..... (5)
4' Bud scales caplike, not split down the side; mostly shrubs or naturalized trees ..... (6)

5. Year-old branchlets mostly yellowish to grayish; branchlets of current year mostly glabrous; expanded leaf blades mostly lanceolate to ovate and acuminate ..... ***S. amygdaloides***
5' Year-old branchlets mostly reddish, purplish, or brownish; branchlets of current year sometimes hairy; expanded leaf blades mostly lanceolate to narrowly elliptic and acute (acuminate) ..... ***S. bonplandiana***

6. Plants naturalized trees with very brittle branchlets that are easily broken off; expanded leaf blades predominantly lanceolate or lance-elliptic ..... ***S. fragilis***
6' Plants usually shrubs, the branchlets not especially brittle; expanded leaf blades variable ..... (7)

7. Year-old branchlets, and sometimes branchlets of current year, glaucous, sometimes only apparent beland buds ..... (8)
7' Year-old branchlets and branchlets of current year not glaucous ..... (10)

8. Expanded leaf blades glabrous or essentially so ..... ***S. irrorata***
8' Expanded leaf blades hairy at least on underside ..... (9)

9. Expanded leaf blades with silver hairs on underside that are often so dense as to obscure the leaf surface; leaf margins slightly revolute, the blades 1–2.6 cm wide ..... ***S. drummondiana***
9' Expanded leaf blades sparsely to moderately sericeous at least on underside; leaf margins not revolute; the blades 0.6–1.5 cm wide ..... ***S. geyeriana***

10. Branchlets of current year usually red-purple and appressed-hairy; bark of 2-year-old branchlets cracked, giving a white-streaking appearance; buds often with depressed margins ..... ***S. bebbiana***
10' Branchlets and buds not as above ..... (11)

11. Plants with mostly oblanceolate to obovate leaf blades; freshly stripped bark of living branchlets of previous year usually with a "skunky" odor; large shrubs of drier upland sites ..... ***S. scouleriana***
11' Plants not as above ..... (12)

12. Most leaves entire or nearly so ..... (13)
12' Most leaves toothed ..... (17)

13. Expanded leaves glabrous or nearly so ..... (14)
13' Expanded leaves usually obviously hairy, rarely glabrate ..... (15)

14. Year-old branchlets usually reddish and shiny; upper side of leaf surface shiny ..... ***S. planifolia***
14' Year-old branchlets mostly reddish brown, yellowish, or greenish and dull; upper side of leaf surface dull ..... ***S. eriocephala***

15. Leaf blades mostly oblong or narrowly elliptic to oblanceolate (obovate), mostly 3.5–12.5 cm long; lowland shrub ..... ***S. lasiolepis***
15' Leaf blades mostly elliptic to oblanceolate or elliptic-obovate, mostly 2–6 (8) cm long; mountain shrubs ..... (16)

16. Expanded leaf blades mostly 3–8 cm long, usually glabrous to moderately hairy; petioles mostly over 3 mm long ..... ***S. glauca***
16' Expanded leaf blades mostly 2–4 cm long, usually densely hairy; petioles mostly less than 3 mm long ..... ***S. brachycarpa***

17. Leaf blades mostly elliptic, dark green and shiny on upper side; year-old branchlets usually reddish and shiny ..... ***S. planifolia***
17' Leaf blades mostly lanceolate to ovate or obovate, if elliptic, the leaves not shiny on upper side and the year-old branchlets not reddish and shiny ..... (18)

18. Petioles usually with glands near base of leaf blade; leaf tips mostly acuminate ..... (19)
18' Petioles usually lacking glands; leaf tips mostly acute to rounded ..... (20)

19. Leaves glabrous even when young (except first one emerging from the bud); stipules lacking or merely glands ..... ***S. serissima***
19' Leaves often hairy at least when young; stipules usually developed, occasionally deciduous, rarely reduced to glands ..... ***S. lasiandra***

20. Petioles often reddish; leaf blades usually ovate, obovate, or broadly elliptic; branchlets of current year hairy ..... ***S. monticola***
20' Petioles usually green; leaf blades often lanceolate, elliptic, or oblanceolate; branchlets of current year often glabrous ..... (21)

21. Leaf blades oblong or narrowly elliptic to oblanceolate (obovate), usually hairy at least on underside; lowland shrubs ..... ***S. lasiolepis***
21' Leaf blades predominantly lanceolate or lance-ovate to elliptic, occasionally oblong, glabrous or glabrate when expanded; shrubs mostly in foothills and mountains ..... ***S. eriocephala***

22. Bud scales split down the side toward branch, with the free margins overlapping; lower-elevation tree ..... ***S. gooddingii***
22' Bud scales caplike, not split down the side; mostly shrubs ..... (23)

23. Leaf blades mostly linear or linear-elliptic, remotely denticulate or serrulate to entire; petioles short and thick (rarely to 6 mm long) or none ..... ***S. exigua***
23' Leaf blades mostly broader, closely toothed to entire; petioles usually well developed and slender ..... (24)

24. Petioles usually lacking glands; leaves mostly persistently hairy, the tips mostly acute to obtuse ..... ***S. wolfii***
24' Petioles usually with glands near base of leaf blade; leaves usually glabrous when expanded, the tips mostly acuminate ..... (25)

25. Leaves glabrous even when young (except first one emerging from the bud); stipules lacking or reduced to glands ..... ***S. serissima***
25' Leaves often hairy at least when young; stipules usually developed, occasionally deciduous, rarely reduced to glands ..... ***S. lasiandra***

Salix amygdaloides Andersson (resembling a peach) Peachleaf willow. Tree to 15 (30) m high; year-old branchlets mostly yellowish to grayish, glabrous. **LEAVES** mostly lanceolate to ovate; petioles 5–21 mm long; the blades 5.5–13 cm long, (0.7) 1–3.7 cm wide, base rounded to acute, tip acuminate, serrulate, glaucous on underside, glabrous or

becoming so. **CATKINS** coetaneous, 2.5–11 cm long, rather lax, on leafy branchlets 0.4–3.5 (6) cm long; flower bracts greenish, whitish, or yellowish to tawny, deciduous in fruit, with long, crinkly hairs denser toward base; stamens 5–8. **CAPSULES** glabrous, 3–5.5 mm long, styles 0.3–0.6 mm long, stipes 1.2–3.2 mm long. $2n = 38$. Stream banks, flood plains, shores, marshes, and seeps. ARIZ: Apa; COLO: Arc, Dol, LPl, Mon; NMEX: McK, Sln; UTAH. 1150–2350 m (3800–7700'). Flowering: Apr–Jun. Fruit: May–Jun. British Columbia to southern Quebec, south to Arizona, northern Chihuahua, and western Kentucky. Hybridizes with *S. gooddingii* (*S. xwrightii* Andersson).

Salix arctica Pall. (northern, referring to its Arctic location) Arctic willow. Creeping shrub less than 10 cm high; year-old branchlets brown or reddish brown (yellow-brown), glabrous or glabrate. **LEAVES** mostly elliptic (ovate), petioles 2–6 (15) mm long; the blades (1) 1.5–4 cm long, 0.4–1.5 (2) cm wide, base acute to obtuse, tip acute to obtuse, entire, glaucous on underside, either glabrous or pubescent mostly on underside. **CATKINS** coetaneous, (0.7) 1–5.5 cm long, on leafy branchlets (0.5) 1–3 (5.5) cm long; flower bracts brown (black), with long, relatively straight hairs; stamens 2. **CAPSULES** pubescent, 3–6 (7) mm long, styles 0.5–2 mm long, stipes 0–0.8 mm long. $2n = 76, 114$. [*S. petrophila* Rydb.]. Alpine and subalpine. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, Sln. 3350–3950 m (11000–13000'). Flowering: Jun–Aug. Fruit: Jul–Sep. Alaska to Greenland, south to California, northern New Mexico, and Quebec. Eurasia. Our plants are **var. *petraea*** (Andersson) Bebb (rock, referring to its rocky habitat). Alpine willow. $2n = 76$. The variety from British Columbia and Alberta south to California and northern New Mexico.

Salix bebbiana Sarg. (for Michael S. Bebb, 1833–1895, an American willow specialist) Bebb willow. Shrub or small tree to 10 m high; year-old branchlets reddish brown or reddish purple, pubescent to glabrate. **LEAVES** elliptic or sometimes ovate to obovate; petioles 2–15 mm long; the blades (2) 4–8 cm long, 1–3.3 cm wide, base acute to obtuse or rounded, tip acute or rarely obtuse, crenate or irregularly serrate to entire, glaucous on underside, pubescent to glabrate. **CATKINS** coetaneous or subprecocious, 0.6–6 cm long, on leafy branchlets 0.1–6 cm long; flower bracts light brown or tawny, with straight or slightly wavy hairs; stamens 2. **CAPSULES** pubescent, strongly beaked, 5–9 mm long, styles 0.1–0.4 mm long, stipes 2–5 mm long. $2n = 38$. Swamp edges, moist woods, stream banks, and meadows. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, Sln; NMEX: McK, RAr, Sln; UTAH. 2150–3300 m (7000–10800'). Flowering: May–Jun. Fruit: Jun–Aug. Alaska to Newfoundland, south to northern California, New Mexico, and Maryland. Eurasia.

Salix bonplandiana Kunth (for A. J. Alexandre Bonpland, 1773–1858, a French naturalist who collected the species in Mexico) Bonpland willow. Tree to 15 (20) m high. Year-old branchlets reddish, purplish, or brownish (greenish), glabrous or pubescent. **LEAVES** narrowly elliptic to lanceolate; petioles 3–14 (18) mm long; the blades 5–17 (19) cm long, (0.7) 1–3 (4) cm wide, base acute to subcordate, tip acute or acuminate, serrulate to entire, glaucous on underside, glabrous or becoming so. **CATKINS** coetaneous, (1.5) 3–7.5 (9) cm long, often not very lax, on leafy branchlets (0.4) 0.5–4 cm long; flower bracts greenish, whitish, or yellowish to tawny, deciduous in fruit, with crinkly hairs especially toward base; stamens 5–8. **CAPSULES** glabrous, 3–6 mm long, styles 0–0.4 mm long, stipes 0.8–2.8 (3.5) mm long. $2n = 38$. [*S. laevigata* Bebb]. Stream banks, washes, shores, seeps, and ditch banks. NMEX: McK, Sln; 2010–2070 m (6600–6800'). Flowering: Apr–May. Fruit: Jun–Jul. Southwest Oregon to Utah, south to Guatemala. Our plants are **var. *laevigata*** (Bebb) Dorn (smooth and polished, probably referring to the glossy upper leaf surface). Red willow. The variety in southwest Oregon, California, Nevada, Utah, Arizona, northwest New Mexico, and Baja California Norte.

Salix brachycarpa Nutt. (Greek *brachy*, short, + *carpa*, fruit, in this case referring to the catkin) Shortfruit willow. Shrub to 1.5 (3) m high; year-old branchlets reddish brown, pubescent. **LEAVES** elliptic to elliptic-obovate, oblong, or oval; petioles 1–3 (4) mm long; the blades 2–3 (4) cm long, 0.6–1.6 cm wide, base rounded to acute, tip acute to obtuse, entire or with a few glands near base, glaucous on underside, pubescent on both sides. **CATKINS** coetaneous, 0.5–2 (3) cm long, on leafy branchlets 0.2–2 cm long; flower bracts brown (black), with relatively straight hairs; stamens 2. **CAPSULES** pubescent, (4) 5–7 mm long, styles 0.1–0.8 (1.5) mm long, stipes 0–0.5 mm long. $2n = 38$. Alaska to Quebec, south to eastern California and northern New Mexico. Meadows, slopes, bogs, wet alkaline barrens, and stream banks. COLO: Con, Hin, LPl, Min, Mon, RGr, Sln. 2500–4050 m (8200–13300'). Flowering: Jun–Jul. Fruit: Jul–Aug. Our plants are **var. *brachycarpa***. The variety from Yukon Territory to Quebec, south to eastern California and northern New Mexico.

Salix drummondiana Barratt ex Hook. (for Thomas Drummond, 1780–1835, Scottish naturalist with the second Franklin Expedition who collected the species in the Canadian Rockies) Drummond willow. Shrub to 6 m high; year-old branchlets reddish brown, glabrous or glabrate, usually glaucous at least behind buds. **LEAVES** elliptic or oblong (lanceolate) to elliptic-obovate; petioles 2–12 mm long; the blades 4–11 cm long, 1–2.6 cm wide, base and tip acute, entire to rarely crenate, glaucous on underside, glabrous or sparsely pubescent on upper side, silver-sericeous to rarely

glabrate on underside. **CATKINS** precocious (subprecocious), 1.5–6 (11) cm long, sessile or subsessile; flower bracts brown (black), with relatively straight hairs; stamens 2. **CAPSULES** pubescent, 3–5.6 mm long, styles 0.4–1.8 mm long, stipes 0.1–2 mm long. $2n = 38, 76$. Stream banks, swamps, and thickets. COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; UTAH. 2250–3350 m (7400–11000'). Flowering: May–Jul. Fruit: Jun–Jul. Yukon Territory to Newfoundland, south to California, New Mexico, Michigan, and New Hampshire.

Salix eriocephala Michx. (wool head, referring to the hairy catkins). Heartleaf willow. Shrub, or rarely treelike, to 8 m high; year-old branchlets reddish brown to greenish yellow (ashy white), glabrous (pubescent). **LEAVES** elliptic, oblong, or lanceolate to lance-ovate, rarely oblanceolate or elliptic-obovate; petioles 3–15 (25) mm long; the blades (3.5) 4–10 (12) cm long, (0.8) 1–3 (4.5) cm wide, base mostly rounded (acute or subcordate), tip mostly acute, serrulate (serrate) to entire, glaucous on underside, glabrous or glabrate. **CATKINS** subprecocious to coetaneous, 1–6 cm long, sessile or on leafy branchlets to 0.9 (1.7) cm long; flower bracts brown or black, with tangled, crinkly hairs especially toward base, sometimes glabrate; stamens 2. **CAPSULES** glabrous, 3–6 mm long, styles 0.1–0.7 mm long, stipes 0.5–4 (4.5) mm long. $2n = 38$. [*S. rigida* Muhl.]. Southern Yukon to Newfoundland, south to California and northwest Florida. Six varieties, two in the Four Corners region.

1. Year-old branchlets predominantly reddish or reddish brown (avoid severely browsed shoots); stipes 0.5–2 (2.5) mm long ..... **var. *ligulifolia***
1' Year-old branchlets predominantly yellowish or greenish; stipes (1) 1.5–4 (4.5) mm long ..... **var. *watsonii***

var. *ligulifolia* (C. R. Ball) Dorn (strap leaf, referring to the leaf shape) Strapleaf willow. Year-old branchlets predominantly reddish brown. **LEAVES** lanceolate to elliptic, occasionally oblong, rarely oblanceolate; petioles 3–12 (15) mm long; the blades 5–10 (12) cm long, 1–2.5 (3.5) cm wide. **CATKINS** 2–6 cm long, sessile or on leafy branchlets to 0.9 cm long. **CAPSULES** 3.5–6 mm long, styles 0.1–0.7 mm long, stipes 0.5–2 (2.5) mm long. $2n = 38$. [*S. ligulifolia* C. R. Ball ex C. K. Schneid.]. Stream banks, shores, swamps, and other moderately wet areas. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon; NMEX: RAr, SJn; UTAH. 1700–2750 m (5600–9000'). Flowering: Apr–May. Fruit: May–Jun. The variety from southern Oregon to southeast Wyoming, south to California and New Mexico but skipping Nevada.

var. *watsonii* (Bebb) Dorn (for Sereno Watson, 1826–1892, American botanist who collected the variety in Nevada) Yellow willow. Year-old branchlets predominantly greenish yellow (ashy white). **LEAVES** lanceolate to lance-ovate or broadly elliptic, rarely elliptic-obovate; petioles 4–15 (25) mm long; the blades (3.5) 4–8 (12) cm long, (0.8) 1–3 (4.5) cm wide. **CATKINS** 1–6 cm long, sessile or on leafy branchlets to 0.7 (1.7) cm long. **CAPSULES** 3–5.5 mm long, styles 0.2–0.7 mm long, stipes (1) 1.5–4 (4.5) mm long. $2n = 38$. [*S. lutea* Nutt.]. Stream banks, shores, swamps, and other moderately wet areas. UTAH. 1350–2450 m (4500–8000'). Flowering: May–Jun. Fruit: Jun. The variety from southeast Washington to Montana, south to California, northern Arizona, and northwest Colorado. There is some intergrading with var. *ligulifolia*.

Salix exigua Nutt. (Latin *exiguus*, weak or small) Sandbar willow. Shrub to 5 m high. Year-old branchlets grayish, brownish, or reddish brown (yellowish, purplish), glabrous or sometimes pubescent. **LEAVES** mostly linear (narrowly elliptic); petioles 0.5–6 mm long; the blades (3) 4–16 cm long, 0.3–1.1 cm wide, base and tip mostly acute, entire or serrulate with the teeth widely spaced, nonglaucous, pubescent (glabrous). **CATKINS** coetaneous or serotinous, (1) 1.5–10 cm long, on leafy branchlets 0.5–18 cm long; flower bracts greenish, whitish, or yellowish to tawny, deciduous in fruit, with straight or wavy hairs at least toward base (glabrate); stamens 2. **CAPSULES** 3–5 (7) mm long, glabrous or pubescent, styles 0–0.2 mm long, stipes 0–1.5 (2) mm long. $2n = 38$. Stream banks, floodplains, washes, shores, and ditch banks. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1150–3000 m (3800–9900'). Flowering: Apr–Aug. Fruit: May–Aug. Alaska to New Brunswick, south to Baja California Norte, Louisiana, and Maryland. Our plants are **var. *exigua***, coyote willow. The variety from southern British Columbia and Alberta south to Baja California Norte and western Texas.

Salix fragilis L. (fragile, referring to the brittle branchlets) Crack willow. Introduced tree to 15 (25) m high. Year-old branchlets mostly yellow-brown, glabrous or sparsely pilose. **LEAVES** lanceolate or lance-elliptic; petioles 7–20 mm long; the blades (7) 10–17 cm long, 1.7–3.5 cm wide, base acute to obtuse, tip acute or acuminate, serrate, glaucous on underside, glabrous. **CATKINS** coetaneous, (2) 4–8 cm long, on leafy branchlets 1–5 cm long; flower bracts greenish, whitish, or yellowish to tawny, deciduous in fruit, with straight or wavy hairs; stamens 2. **CAPSULES** glabrous, 4–5.5 mm long, styles 0.3–0.8 mm long, stipes 0.5–1 mm long. $2n = 38$–114. Introduced from Eurasia and occasionally escaping on stream banks, ditch banks, and shores. COLO: Arc, LPl, Mon; NMEX: SJn. 1550–2350 m (5100–7700').

Flowering: Apr–May. Fruit: May–Jun. Frequently confused with *S. alba* L., another introduced species sparingly planted in the Four Corners region, but which does not escape cultivation.

Salix geyeriana Andersson (for Carl Andreas Geyer, 1809–1853, German botanist who collected the species in Idaho) Geyer willow. Shrub to 7 m high; year-old branchlets reddish brown or purplish brown (yellow-brown), usually glaucous at least behind buds, glabrous. **LEAVES** mostly lance-elliptic or elliptic; petioles 2–9 mm long, the blades 2–8 cm long, 0.6–1.5 cm wide, base and tip mostly acute, entire or nearly so, mostly glaucous or glaucescent on underside, usually pubescent on both sides. **CATKINS** coetaneous, 0.6–2 (2.5) cm long, on leafy branchlets 0.1–1.2 (1.8) cm long; flower bracts tawny or light brown, with short, straight or slightly wavy hairs; stamens 2. **CAPSULES** pubescent, 3–6 mm long, styles 0.1–0.8 mm long, stipes 1–3 mm long. $2n = 38$. Edges of swamps, moist meadows, and stream banks, mostly montane. COLO: Hin, SJn. Common around Silverton, Colorado, 2150–3250 m (7100–10700'). Flowering: May–Jun. Fruit: Jul. Southern British Columbia to Montana, south to California and New Mexico.

Salix glauca L. (gray, referring to the leaf color) Gray willow. Shrub to 1.5 (4) m high, year-old branchlets reddish brown to grayish, pubescent to glabrate. **LEAVES** mostly elliptic to oblanceolate (obovate), stipules inconspicuous, the blades 3–6 (8) cm long, 0.7–3.5 cm wide, base acute to rounded, tip acute to rounded, entire or sometimes serrulate toward base, glaucous on underside, pubescent to glabrous, petioles 2–10 (16) mm long. **CATKINS** coetaneous, (2) 3–4 (5) cm long, on leafy branchlets 0.5–3.5 cm long; flower bracts brown (greenish), with relatively straight (slightly wavy) hairs; stamens 2. **CAPSULES** pubescent, 4–9 mm long, styles 0.3–1 mm long, stipes 0.2–1.8 mm long. $2n = 76$–190. Stream banks and subalpine slopes. COLO: Con, Hin, LPl, Min, Mon, RGr, SJn. 3080–3800 m (10100–12500'). Flowering: Jul–Aug. Fruit: Jul–Sep. Alaska to Greenland, south to northern New Mexico, Manitoba, and Nova Scotia. Eurasia. Our plants are **var. *villosa*** Andersson (Latin *villosus*, long-hairy, referring to the leaves). $2n = 114$. This is the variety from Yukon to Nunavut and Manitoba south to Utah and northern New Mexico, sometimes appearing to intergrade with *S. brachycarpa*.

Salix gooddingii C. R. Ball (for Leslie Newton Goodding, 1880–1967, western American botanist who collected the species in Nevada) Goodding willow. Tree to 15 (30) m high; year-old branchlets gray, yellowish, or pale yellowish brown, glabrous, sometimes tardily so. **LEAVES** linear or oblong to lance-linear or narrowly elliptic; petioles 3–10 mm long, the blades 6–13 cm long, 0.8–1.6 cm wide, base acute, tip acuminate, serrulate or serrate, nonglaucous, glabrous or becoming so. **CATKINS** coetaneous, 2.2–8 cm long, rather lax, on leafy branchlets 0.4–3 cm long; flower bracts greenish, whitish, or yellowish to tawny, deciduous in fruit, with short, wavy hairs; stamens 5–8. **CAPSULES** glabrous or pubescent, 3–7 mm long, styles 0–0.4 mm long, stipes 1–3.2 mm long. $2n = 38$. Stream banks, shores, floodplains, washes, and seeps. ARIZ: Apa, Nav; NMEX: McK, SJn; UTAH. 1150–2010 m (3800–6600'). Flowering: Apr–May. Fruit: May–Jun. California to western Colorado, south to western Texas and Mexico (Baja California Norte and Sinaloa).

Salix irrorata Andersson (moistened with dew, probably referring to the glaucous branchlets) Bluestem willow. Shrub to 7 m high; year-old branchlets reddish brown or purplish, usually glaucous, glabrous. **LEAVES** oblong, narrowly elliptic or oblanceolate; petioles 3–15 mm long; the blades 4.7–12 cm long, (0.5) 0.8–2.2 cm wide, base acute, tip acute to obtuse, entire to serrate or crenate, glaucous on underside, glabrous or rarely sparsely pubescent. **CATKINS** precocious or subprecocious, 1.5–4.2 cm long, sessile or on leafy branchlets to 0.5 cm long; flower bracts brown, with long, relatively straight hairs; stamens 2. **CAPSULES** glabrous, 3–5 mm long, styles 0.2–0.9 mm long, stipes 0.3–1.2 mm long. $2n = 38$. Rocky stream banks and washes, mostly low montane. ARIZ: Apa; COLO: Arc, Hin, LPl, Min; NMEX: McK. 1980–2400 m (6500–7900'). Flowering: Apr–May. Fruit: May. Southeast Wyoming, Colorado, New Mexico, and eastern Arizona.

Salix lasiandra Benth. (hairy male, referring to the hairy stamens) Longleaf willow. Shrub or tree to 15 m high; year-old branchlets yellow-brown to reddish brown or gray-brown, pubescent or glabrous. **LEAVES** lanceolate or sometimes elliptic; petioles 5–30 mm long; the blades 2.4–17 (20) cm long, 0.9–4.3 cm wide, base acute to rounded, tip acute or acuminate, serrate or serrulate, glaucous or not on underside, glabrous to occasionally pilose. **CATKINS** coetaneous, 1.7–10 cm long, on leafy branchlets 0.8–6.5 cm long; flower bracts greenish, whitish, or yellowish to tawny, often toothed or lobed, deciduous in fruit, with short, wavy hairs near base or glabrate; stamens 5–8. **CAPSULES** glabrous, 4–7 mm long, styles 0.2–1 mm long, stipes 0.5–2 (4) mm long. $2n = 76$. Alaska to western Manitoba, south to California and New Mexico. Two varieties, both in the Four Corners region, are sometimes treated as subspecies of *S. lucida* Muhl. Definite intergrading with that eastern species has not been demonstrated.

1. Leaves not glaucous on underside ..... **var. *caudata***
1′ Leaves glaucous on underside ..... **var. *lasiandra***

var. *caudata* (Nutt.) Sudw. (tailed, referring to the acuminate, tail-like leaf tip) Whiplash willow. **LEAVES** not glaucous. $2n = 76$. Stream banks, shores, wet meadows, and seeps. COLO: Arc, Dol, LPl, SJn. 1950–2900 m (6400–9500′). Flowering: May–Jun. Fruit: Jun–Jul. The variety from southern British Columbia to southwest Saskatchewan, south to eastern California and northern New Mexico. Intermediates to var. *lasiandra* can be expected on the northern edge of the Four Corners region.

var. *lasiandra* Longleaf willow. **LEAVES** glaucous on underside. $2n = 76$. Stream banks, shores, wet meadows, and seeps. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, RAr, SJn; UTAH. 1650–3150 m (5400–10300′). Flowering: Apr–Jul. Fruit: Jun–Jul. The variety from Alaska to western Manitoba, south to California and New Mexico but replaced by var. *caudata* in much of the Rocky Mountain and Great Basin regions.

Salix lasiolepis Benth. (hairy scale, referring to the floral bracts) Arroyo willow. Shrub (ours) or tree to 12 m high; year-old branchlets yellow, green, or reddish brown, pubescent to glabrate (glabrous). **LEAVES** oblong, narrowly elliptic, or oblanceolate to obovate; petioles 2–16 (20) mm long; the blades (2.5) 3.5–12.5 (22) cm long, 0.6–3.2 (4.5) cm wide, base acute, tip acute to obtuse, entire to irregularly serrate or crenate, glaucous on underside, densely pubescent to glabrate on both sides, or becoming glabrous on upper side (and lower side). **CATKINS** precocious or subprecocious, 1.5–7 (9) cm long, sessile or on leafy branchlets to 0.7 cm long; flower bracts brown (black), with dense, straight to slightly wavy hairs; stamens 2. **CAPSULES** glabrous, 2.5–5.5 mm long, styles 0.2–0.8 (1) mm long, stipes 0.5–1.8 (2.2) mm long. $2n = 76$. Stream banks, washes, seeps, and shores. ARIZ: Apa, Nav; NMEX: McK, SJn; UTAH. 1550–2470 m (5100–8100′). Some specimens suggest possible gene exchange with *S. irrorata*. Flowering: Apr–May. Fruit: Apr–Jun. Washington and western Idaho south to Mexico (Baja California Sur, Jalisco, and San Luis Potosí).

Salix monticola Bebb (mountain-dwelling, referring to the mountain habitat) Mountain willow. Shrub to 6 m high; year-old branchlets reddish brown or yellowish, glabrous or rarely pubescent. **LEAVES** ovate, lanceolate, or elliptic to obovate; petioles 5–14 mm long; the blades 3–8 (9.5) cm long, (1) 1.5–3.5 cm wide, base acute to rounded, tip acute, crenate or serrate or serrulate (subentire), glaucous on underside, glabrous. **CATKINS** precocious to coetaneous, 1–5 (6) cm long, subsessile or on leafy branchlets to 0.8 (1.7) cm long; flower bracts brown (black), with long, straight or curly hairs; stamens 2. **CAPSULES** glabrous, 3–6 mm long, styles 0.6–1.5 (1.8) mm long, stipes 0.3–1.5 (2) mm long. $2n = 114$. Stream banks and wet meadows in or near mountains. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, SJn; UTAH. 1800–3600 m (5900–11800′). Flowering: May–Jun. Fruit: May–Jul. Southern Wyoming, eastern Utah, Colorado, eastern Arizona, and northern New Mexico.

Salix monticola

Salix planifolia Pursh (flat leaf) Planeleaf willow. Shrub to 5 m high; year-old branchlets dark brown or reddish brown to red, glabrous or glabrate, occasionally lightly glaucous. **LEAVES** elliptic (lance-elliptic to obovate); petioles 3–13 mm long; the blades (2) 3.5–5 (8) cm long, 0.9–1.5 (2.2) cm wide, base and tip acute, entire to sometimes crenate or serrate, shiny and glabrous or glabrate on upper side, sparsely pubescent often with some reddish hairs (glabrous) and glaucous on underside. **CATKINS** precocious or subprecocious, (1) 1.5–6 cm long, sessile or subsessile; flower bracts brown (tawny), with long, relatively straight, often tawny hairs; stamens 2. **CAPSULES** pubescent, (3.5) 5–6 mm long, styles 0.4–1.8 mm long, stipes 0–1 mm long. $2n = 76$. Wet meadows, subalpine slopes, fens, and willow swamps. COLO: Con, Hin, LPl, Min, Mon, RGr, SJn. 3050–4000 m (10000–13100′). Flowering: Jun–Jul. Fruit: Jul–Aug. Our plants are **var. *planifolia***, the variety from Yukon to Newfoundland, south to eastern California, northern New Mexico, northern Minnesota, and New Hampshire. Another variety is endemic on the Lake Athabasca sand dunes, Saskatchewan.

Salix reticulata L. (netted, referring to the network of veins in the leaves) Net willow. Creeping shrub less than 10 cm high; year-old branchlets light brown to reddish brown (yellow-brown), glabrous. **LEAVES** mostly oval to suborbicular (elliptic); petioles 1–15 (28) mm long; the blades 0.4–2.5 (3.6) cm long, 0.3–1.5 (2.3) cm wide, base obtuse to rounded (subcordate), tip obtuse to rounded (retuse), entire, slightly revolute, glaucous on underside, glabrous or with sparse, long hairs mostly on underside. **CATKINS** serotinous, 0.5–2 (3) cm long, on naked branchlets 2–20 mm long; flower bracts greenish (tawny or brown), glabrous externally, with wavy hairs on inner surface; stamens 2. **CAPSULES** pubescent, 1.5–4 mm long, styles 0.1–0.4 mm long, stipes 0–0.5 mm long. $2n = 38$. [*S. nivalis* Hook.]. Alpine and subalpine. COLO:

Arc, Con, Hin, LPl, Min, Mon, SJn. 3450–4050 m (11300–13300'). Flowering Jun–Aug. Fruit Jul–Sep. Alaska to Newfoundland, south to eastern California, northern New Mexico, and northern Quebec. Eurasia. Our plants are **var. *nana*** Andersson (dwarf, referring to the small size of the plants). Snow willow. This is the variety from British Columbia and Alberta south to eastern California and northern New Mexico.

Salix scouleriana Barratt ex Hook. (for John Scouler, 1804–1871, Scottish surgeon-naturalist on a Hudson's Bay Company voyage who collected the species around the Columbia River) Scouler willow. Shrub or small tree to 15 (20) m high; year-old branchlets reddish brown to yellow-brown, usually pubescent. **LEAVES** elliptic to obovate; petioles 3–10 (18) mm long; the blades 3–8 (10) cm long, (1.3) 2–3 cm wide, base acute, tip acute to rounded, entire to irregularly serrulate or somewhat crenate, glaucous on underside, pubescent at least along midrib on underside. **CATKINS** precocious, 1.5–5 (7) cm long, sessile or on leafy branchlets to 1.3 cm long; flower bracts brown (black), with relatively straight hairs; stamens 2. **CAPSULES** pubescent, strongly beaked, 4.5–11 mm long, styles 0.2–1.1 mm long, stipes 0.8–2.8 mm long. $2n = 76, 114$. Woods, slopes, and meadows, rarely on shores. ARIZ: Apa. COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, SJn; UTAH: 2350–3250 m (7700–10700'). Flowering: Apr–Jun. Fruit: May–Jul. Alaska to Manitoba, south to California, New Mexico, and Coahuila.

Salix serissima (L. H. Bailey) Fernald **CP** (very late, referring to the late-maturing fruits) Autumn willow. Shrub to 5 m high; year-old branchlets reddish brown to tan, glabrous. **LEAVES** lanceolate or elliptic; petioles 4–11 mm long; the blades 4–10 cm long, 1.5–2.7 (3.5) cm wide, base acute to rounded, tip acute or acuminate, serrulate, glaucescent or pale on underside, glabrous. **CATKINS** serotinous, (1) 2–5 cm long, on leafy branchlets 1–5 cm long; flower bracts greenish, whitish, or yellowish to tawny, deciduous in fruit, with straight to slightly wavy hairs; stamens 5–8. **CAPSULES** glabrous, (6) 7–12 mm long, maturing in summer, styles 0.1–0.8 mm long, stipes 0.8–2 mm long. $2n = 76$. Swamps and bogs. COLO: LPl. West side of Haviland Lake at 2500 m (8200'). Flowering: May–Jul. Fruit: Jul–Sep. Northwest Territories to Newfoundland, south to Colorado and New Jersey.

Salix wolfii Bebb (for John Wolf, 1820–1897, botanist with the Wheeler Expedition who collected the species in Colorado) Wolf willow. Shrub to 1 (2) m high; year-old branchlets reddish brown (yellow-brown), pubescent or glabrous. **LEAVES** mostly elliptic, lanceolate, or oblanceolate; petioles 2–10 mm long; the blades 2–6 cm long, 0.5–1.5 (2) cm wide, base rounded or obtuse (acute), tip acute (obtuse), entire, nonglaucous, pubescent on both sides. **CATKINS** coetaneous, 0.8–2 (3) cm long, subsessile or on leafy branchlets to 1.2 cm long; flower bracts brown or black, with long (short), straight to wavy hairs; stamens 2. **CAPSULES** glabrous, 3.5–5 mm long, styles 0.2–1.3 mm long, stipes 0–0.8 mm long. $2n = 38$. Wet meadows and stream banks, subalpine to upper montane. COLO: Hin, Min, RGr, SJn; 3110–3550 m (10200–11700'). Flowering: Jun–Jul. Fruit: Jul–Aug. Northeast Oregon to Montana, south to northeast Nevada, Utah, and northern New Mexico. Our plants are **var. *wolfii*** This is the variety from southwest Montana to north-central Wyoming, south to Utah and northern New Mexico.

SANTALACEAE R. Br. SANDALWOOD FAMILY

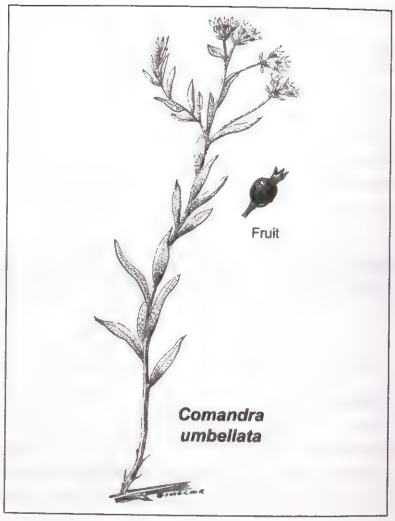
Linda Mary Reeves

(Latin *santalum*, sandalwood) Trees, shrubs, or herbs, photosynthetic, but most semi- or root-parasitic, primarily absorbing water and minerals through haustoria, terrestrial, occasionally epiphytic branch parasites. **LEAVES** opposite, occasionally alternate or spirally arranged, simple, entire. **INFL** a spike, raceme, corymb, or head. **FLOWERS** actinomorphic; perfect or unisexual; greenish, pinkish, or whitish; perianth of 1 whorl, tubular with 3–8 (usually 4, 5) lobes, sometimes fleshy; stamens fused to perianth tube and opposite the lobes; nectary disc often surrounding the ovary or fused to perianth tube; ovary inferior or semi-inferior, generally unilocular, of 2–5 carpels; stigma lobed or capitate; ovule pendulous. **FRUIT** a nut or drupe. **SEEDS** solitary, with copious fleshy or oily endosperm. A family of about 35 genera, about 400 species, primarily in dry tropical or subtropical habitats. *Santalum album*, the sandalwood tree, yields a fragrant wood useful for carving. The oil is used in soap, incense, and perfumes.

Comandra Nutt. Bastard Toadflax

(Greek *come*, hair, + *aner*, man, alluding to hairs of perianth lobes attached to the anthers) Perennial, erect, glabrous rhizomatous herbs or shrubs 7–50 cm tall, partially root-parasitic on other angiosperms. **STEMS** branching freely at base, 5–45 cm tall; rhizome cortex blue when fresh, turning black when dried. **LEAVES** alternate, subsessile to short-petiolate, linear-lanceolate to ovate-oblong, entire, acute, somewhat fleshy, 5–60 mm long, 1–16 mm wide; base mostly acute; apex acute to obtuse. **INFL** a cluster of 3–6 flowered cymes, each subtended by a bract. **FLOWERS**

perfect, 3–7 mm wide; pedicel 0–4 mm long, subtended by 1–3 bracts; perianth rotate to campanulate, with 3–7 (usually 5) lobes, white to pinkish to purplish, spreading, with long hairs on the inner surface adjacent to the anthers; style filiform, 2–3 mm long; stigma capitate. **FRUIT** an ovoid or globose drupe, glabrous to slightly rough, 4–8 mm long, yellow to brown when mature; mesocarp somewhat fleshy. $2n = 28$. Monospecific genus with several subspecies.



Comandra umbellata (L.) Nutt. (umbellate, referring to an inflorescence similar to the Apiaceae or Umbelliferae) Pale bastard toadflax. Herbs 5–34 cm tall, herbage dying down in winter. **LEAVES** linear or lanceolate, grayish green, fleshy, glaucous, 0.5–4.5 cm long. **FLOWER** perianth lobes lanceolate, 2.5–4 mm long. **FRUIT** 6–9 mm diameter, slightly roughened or ridged. Open slopes, blackbrush, desert scrub, piñon-juniper, ponderosa pine, and spruce-fir, often in sandy soils, sometimes along creeks, commonly associated with sandstones. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1400–2700 m (4600–8900'). Flowering: Apr–Aug. Fruit: May–Sep. Most of the United States (except Louisiana and Florida), southern Canada, northern Mexico, and the Balkans. Our specimens belong to **subsp. *pallida*** (A. DC.) Piehl, which is restricted to the western United States.

SAURURACEAE Rich. ex T. Lestib. LIZARD-TAIL FAMILY

Kenneth D. Heil

(Greek *saur*, lizard) Perennial herbs, rhizomatous or stoloniferous, more or less aromatic. **STEMS** simple or branched, often scapelike. **LEAVES** mostly basal, alternate, simple, petiolate, stipules adnate to the petiole. **INFL** a dense spike or lax raceme, sometimes subtended by involucral bracts. **FLOWERS** small, perfect, perianth lacking; stamens (3–) 6–8, hypogynous or epigynous; anthers bilocular; pistil 1, of 3–5 (–7) carpels, styles and stigmas distinct. **FRUIT** a schizocarp or in ours, a capsule. **SEEDS** 1–40. $x = 11$. Five genera, seven species. North and Central America, eastern Asia.

Anemopsis Hook. & Arn. Yerba Mansa

(Greek *anemo*, wind) Plants 1–5 dm tall, glabrous or pubescent. **LEAVES** basal and cauline; basal leaves petioled, the blades 3.5–10 cm long, elliptic-oblong with a truncate or cordate base, entire, petioles as long or longer than the blades; cauline leaves sessile and clasping; 1–3 small, petioled leaves in the axils. **INFL** a terminal, congested, conic spike of 75–100 (–150) flowers, subtended by 4–9 white to reddish petaloid bracts, 0.5–3.5 cm long. **FLOWERS** each subtended by an adnate, white, ovate, clawed bract; stamens 6 (–8), epigynous; pistil 1, of 3 (–4) carpels, ovary inferior. **FRUIT** a capsule, the carpels adnate but easily separated. **SEEDS** 6–10, brown, reticulate. One species in the western United States.

Anemopsis californica Hook. & Arn. (of California) $2n = 22$. [*A. californica* var. *subglabra* Kelso]. In alkaline soils of wet meadows, and along streams. ARIZ: Apa. 1650 m (5450'). Flowering: May–Jun. Fruit: Aug–Sep. Oregon and California to Kansas and Texas, south to Mexico. In the San Juan River drainage, yerba mansa is known only from Canyon de Chelly. The major uses are a drug for colds, disinfectant, blood medicine, and dermatological and gastrointestinal aid. The pulverized seeds have been used in making bread.

SAXIFRAGACEAE Juss. SAXIFRAGE FAMILY

Roy L. Taylor

(Latin for stone breaking, referring to purported ability of medicinals to treat kidney stones) Perennial herbs. **LEAVES** alternate, sometimes all basal, or less often opposite, simple or pinnately or palmately compound, stipules absent. **INFL** a cyme, raceme, or flowers solitary. **FLOWERS** regular or somewhat irregular, perfect or rarely unisexual, perigynous to often partly or wholly epigynous; sepals 3–10, mostly 5; petals 3–10, mostly 5, often clawed, sometimes cleft or dissected, well developed or relatively small and inconspicuous; stamens as many as or twice as many as the petals;

nectary sometimes present as an intrastaminal disc or annulus; gynoecium of 2–5 (mostly 2) carpels, ovules several to usually numerous on each placenta. **FRUIT** usually a capsule. **SEEDS** more or less numerous, small. x = 7–17, mostly 7. About 35 genera and 650 species, cosmopolitan in distribution (Cronquist, Holmgren, and Holmgren 1997a; Welsh et al. 2003.)

1. Leaves all basal, distinctly and often abruptly petioled, not lobed more than 1/2 the distance to the midrib; flowers on naked scapes or these with a solitary bract; stamens 5 or 10 ..... (2)
1' Leaves not all basal, or sometimes so in depauperate plants, the blades not distinctly petioled or else lobed more than 1/2 the distance to the midrib; flowers often not scapose; stamens 10 ..... (4)

2. Flowers in very narrow, spikelike, ebracteate racemes, petals parted or divided into filiform segments; leaves toothed and lobed ..... ***Mitella***
2' Flowers not in spikelike racemes or, if so, bracteate; petals entire; leaves various ..... (3)

3. Stamens 5; leaves crenate-toothed and lobed; plants of cliffs and rocky outcrops ..... ***Heuchera***
3' Stamens 10; leaves subentire, crenate, or very coarsely dentate but not lobed; stamens 10; plants mostly of dry meadows or wet places ..... ***Saxifraga***

4. Leaves parted or divided to the midrib, the basal ones abruptly constricted into slender petioles 0.5–10 cm long; petals deeply lobed or cleft ..... ***Lithophragma***
4' Leaves entire, toothed, or lobed, but not divided more than 1/2 the distance to the midrib or, if so, sessile or nearly so; petals entire ..... ***Saxifraga***

Heuchera L. Alum-root

Perennial herb from scaly, woody, branched caudex or rootstock. **FLOWERING STEMS** 1 several, simple or several branches, with or without bracts. **LEAVES**: basal stipulate. **INFL** a raceme or scalelike bracteate cyme, few flowers. **FLOWERS** perfect, regular; hypanthium calyxlike, partly fused to ovary; petals lobed or toothed; sepals 5, petals 5; stamens 10; pistil 1; ovary superior to 1/2 inferior, placentas 3, styles 3. **FRUIT** a capsule. **SEEDS** several. Plants indigenous to North America. About 55 species throughout North America.

1. Stamens shorter than sepals; petals about 1–2 mm long, sepals not reddish, pedicels 1–2 mm long or obsolete ..... ***H. parvifolia***
1' Stamens exserted 1–4 mm beyond sepals; petals 3–4 mm long, sepals often reddish, pedicels 2–7 mm long ..... ***H. rubescens***

Heuchera parvifolia Nutt. ex Torr. & A. Gray (little leaf) Little leaf alum-root. Slender perennial, caulescent herb. **FLOWERING STEMS** 2–5 dm tall, unbranched, arising from basal rosette, without or with 1–3 inconspicuous bracts, finely glandular, puberulent; hairs, if present, often unequal. **LEAVES** basal leaves glabrous to densely pubescent, deeply 3-lobed to palmately compound, lobes lobed, teeth acute, hairs when present, often unequal. **INFL** 4–14-flowered, a nodding raceme. **FLOWERS** pedicellate, hypanthium long-obconic-elongate at anthesis, becoming elongate in fruit; corolla widely spreading; sepals triangular; petals white, occasionally pink, usually with prominent vein markings, 7–16 mm long, always 3-cleft; ovary inferior. **FRUIT** an elongate capsule. **SEEDS** smooth or wrinkled. (*Heuchera flavescens* Rydb.; *H. utahensis* Rydb.; *H. flabellifolia* Rydb.; *H. duranii* Bacig.) Often in rocky places, piñon-juniper, sagebrush, mountain brush, ponderosa pine, aspen, Douglas-fir, and spruce-fir communities. ARIZ: Apa, Nav, COLO: Ar, Con, Dol, Hin, LPl, Min, Mon, RGr, Sjn, NMEX: McK, RAr, Sie. UTAH: 1775–3960 m (5825–13000'). Flowering May–Sep. Fruit Jul. Alberta to New Mexico and west to Idaho and Nevada. Plant used for rat bites by the Kayenta Navajo. The Ramah Navajo used a decoction of root for stomachache and as a "life medicine."

Heuchera rubescens

Heuchera rubescens Torr. (reddish) Red alum-root. Slender, perennial, caulescent herb. **FLOWERING STEMS** 1.5–3 dm tall, 1 several. Scapose, unbranched, arising from basal rosette herbage. **LEAVES** basal leaves

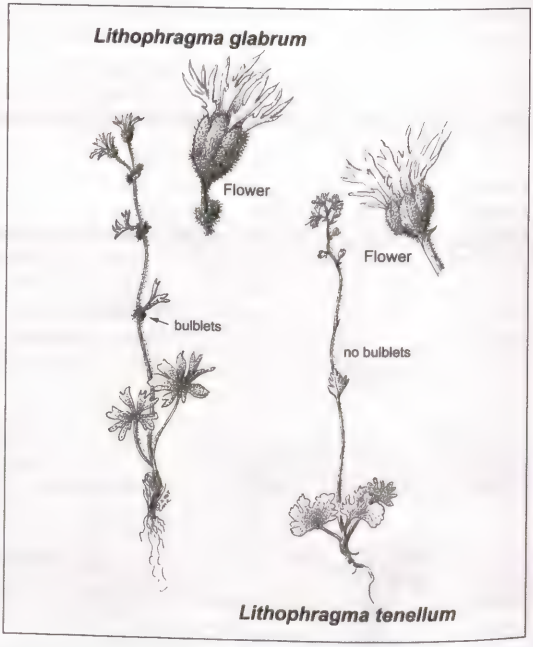
light green, sparsely pubescent, orbicular, short-petiolate to 8 cm long, blade simple to irregularly 3–5-lobed to almost pinnatifid; cauline leaves 2, palmately compound, much reduced, more highly dissected than basal leaves, always appearing pinnatifid; stipules broad, fimbriate, decurrent on petiolar base. **INFL** a 3–12-flowered, compact raceme. **FLOWERS** slightly pendulous; hypanthium campanulate or hemispheric, becoming elongate-campanulate in fruit; sepals triangular, valvate in bud, becoming widespread at anthesis; corolla widely spreading, open at throat, petals pink, occasionally white, ovate, 3–7 mm long, palmately 5-parted; ovary less than 1/2 inferior. **FRUIT** an elongate capsule. **SEEDS** smooth or wrinkled. [*Heuchera versicolor* Greene; *H. rubescens* var. *versicolor* (Greene) M. G. Stewart; *H. clutei* A. Nelson]. Cliff faces and other rocky sites; piñon-juniper, sagebrush, mountain brush, and ponderosa pine communities. ARIZ: Apa; NMEX: McK, SJn; UTAH. 2030–3050 m (6665–10000'). Flowering: May–Aug. Fruit: Sep. Uncommon in study area. California, Oregon, Idaho, south through Nevada, Utah, Arizona, New Mexico, southern Colorado, and Texas to northern Mexico.

Lithophragma (Nutt.) Torr. & A. Gray Woodland Star

Slender, perennial, small herbs from underground rhizomes that may bear bulblets. **FLOWERING STEMS** 1–several; simple or several-branched; 1–10 stem leaves, usually 2; some with numerous bulbils in axils. **LEAVES**: basal leaves petioled, glandular-pubescent, lobed; cauline leaves alternate, petiolate. **INFL** a compact, few-flowered, bracteate cyme or raceme, or solitary flowers. **FLOWERS** perfect; regular; hypanthium calyxlike, partly fused to ovary; sepals 5, triangular; petals 5, narrowly clawed, lobed or toothed, white to pink or purple-tinged; pistil 1; ovary superior to 1/2 inferior, placentas 3; styles 3; valves 3; stamens 10. **FRUIT** a 3-beaked capsule. **SEEDS** several, usually dark brown. About nine species endemic to western North America.

1. Plants with few to several purple bulblets in the inflorescence and usually in axils of the upper leaves; lower pedicels 1.5–3 times longer than the hypanthium ..... ***L. glabrum***
1' Plants without bulblets in the inflorescence or in leaf axils; lower pedicels about 0.5–1.5 times longer than the hypanthium ..... ***L. tenellum***

Lithophragma glabrum Nutt. (glabrous) Slender woodland star, rock star. Slender, perennial, caulescent herb; herbage sparingly pubescent to nearly glabrous. **FLOWERING STEMS** several, usually reddish; 0.8–3.5 dm tall, arising from basal rosette; hirsute, stipitate-glandular, 2–7 leaves. **LEAVES**: basal leaves orbicular, short-petiolate; 1–4 cm; blade usually digitately trifoliate; cauline with petioles 1.5–5.5 cm long, glandular; blades 1.2–6 cm wide, about as long; reniform or orbicular, truncate or cordate at the base, crenate, more or less shallowly lobed; bracts similar to upper leaves but smaller, less toothed, upper ones usually entire; often red-purple bulbils in leaf axils. **FLOWER** sepals 3–4.5 mm long, glandular; petals subequal to sepals or shorter, pinkish or reddish. **HYPANTHIUM** 4–7 mm long, campanulate, glandular to pilose-glandular, often reddish or purplish. **FRUIT** a capsule. **SEEDS** 0.5–0.7 mm long, tuberculate, brown. [*L. bulbiferum* Rydb.]. Sandy to rocky soils; aspen, Gambel's oak, sagebrush, piñon-juniper, mountain brush, and ponderosa pine communities. COLO: Arc, Dol, Mon, SJn, SMg; UTAH. 2260–2475 m (7410–8115'). Flowering: May–Jun. British Columbia to California, east to Alberta, the Dakotas, and Colorado.



Lithophragma tenellum Nutt. (tender) Slender fringecup. Slender, perennial, caulescent herb, herbage light green, sparsely pubescent. **FLOWERING STEMS** 1.5–3 dm tall, 1–several, unbranched, arising from a basal rosette; 2 (1–3)

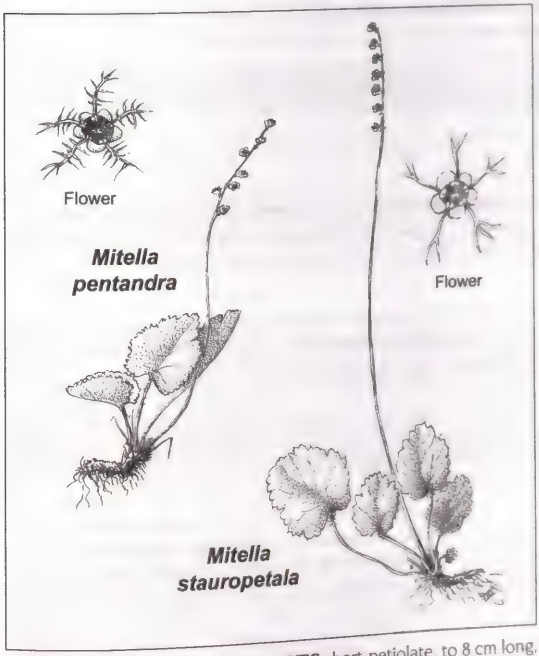
leaves. **LEAVES**: basal orbicular, short-petiolate, to 8 cm long, blade simple to irregularly 3–5-lobed to almost pinnatifid; cauline leaves 2, palmately compound, much reduced, more highly dissected than basal leaves, always appearing pinnatifid; stipules broad, fimbriate, decurrent on petiolar base. **INFL** a 3–12-flowered compact raceme. **FLOWERS** slightly pendulous; sepals triangular, valvate in bud, becoming widespread at anthesis; corolla wide spreading, open at throat, petals pink, occasionally white, ovate, 3–7 mm long, palmately 5-parted; ovary less than 1/2 inferior. **HYPANTHIUM** campanulate or hemispheric, becoming elongate-campanulate in fruit. **FRUIT** a campanulate capsule. **SEEDS** smooth or wrinkled. [*L. australis* Rydb.]. Piñon-juniper woodlands, sagebrush, mountain brush, ponderosa pine, aspen, and riparian communities. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Min, Mon, SMg, NMEX, McK, RAr, Sln; UTAH: 2225–3165 m (7300–10385'). Flowering: Apr–Jun. Washington to Arizona, east to Montana and south to New Mexico.

Mitella L. Bishop's Cap, Mitrewort

(Latin for headband) Perennial herb from scaly, woody, branched caudex or rootstock. **FLOWERING STEMS** 1–several, scapose, simple or several-branched. **LEAVES** all basal. **INFL** borne in compact, few-flowered bracteate cymes; scale-like bracts. **FLOWERS** with a calyxlike hypanthium, partly fused to ovary; petiolate; regular; sepals 5; petals 5, lobed or toothed; stamens 10; pistil 1; ovary superior to 1/2 inferior; chamber 1; placentas 3; styles 3, free or connate below. **FRUIT** a 3-valved capsule. **SEEDS** several. About 20 species in western North America.

1. Racemes not secund; pedicels 2–8 mm long; petals pinnately divided; stamens opposite petals; sepals greenish ..... ***M. pentandra***

1′ Racemes secund; pedicels absent or to 3 mm long; petals with 2–3 lobes; stamens opposite sepals; sepals whitish or purplish ..... ***M. stauropetala***



Mitella pentandra Hook. **CP** (five stamens) Five-star mitrewort. Slender, perennial, caulescent herb; herbage from glabrous to densely pubescent. **FLOWERING STEMS** 2–5 dm tall, unbranched, arising from basal rosette. **LEAVES** deeply 3-lobed to palmately compound, lobes lobed, teeth acute. **INFL** 4–14-flowered, in nodding, open raceme. **FLOWER** hypanthium long-obconic-elongate at anthesis, becoming elongate in fruit; pedicellate; sepals triangular; corolla widely spreading; petals white, occasionally pink, usually with prominent vein markings, 7–16 mm long, always 3-cleft; ovary inferior. **FRUIT** an elongate capsule. **SEEDS** smooth or wrinkled. Often where shaded; aspen, spruce-fir, and willow communities. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, Sln; UTAH: 2650–3640 m (8700–11940'). Flowering: Jun–Aug. Alaska south to northern California, east to Alberta and Colorado.

Mitella stauropetala Piper (cross-shaped petals) Side-flowered mitrewort. Slender, perennial, caulescent herb; herbage light green, sparsely pubescent. **FLOWERING STEMS** 1.5–3 dm tall; 1–several, unbranched; arising from basal rosette base. **LEAVES** short-petiolate, to 8 cm long, blade orbicular, simple to irregularly 3–5-lobed, almost pinnatifid; stipules acute to rounded. **INFL** a 3–12-flowered, compact, secund raceme. **FLOWER** hypanthium campanulate or hemispheric, becoming elongate-campanulate in fruit; slightly pendulous; sepals triangular, valvate in bud, becoming widespread at anthesis; corolla widely spreading, open at throat, petals pink, occasionally white, ovate, 3–7 mm long, palmately 5-parted; ovary less than 1/2 inferior. **FRUIT** a campanulate capsule. **SEEDS** smooth or wrinkled. Mountain brush, aspen, ponderosa pine, and spruce-fir communities. COLO: Arc, Hin, LPl, Min, Mor, Sln; UTAH: 2620–3640 m (8600–11940'). Flowering: Jun–Aug. Washington and Oregon to Montana, and south to Colorado.

Saxifraga L. Saxifrage

(Latin for stone breaking) Mostly small perennial herbs; some short-lived, a few annual; some reproducing by stolons. **FLOWERING STEMS** may be scapose; many with evergreen leaves; alternate; commonly caespitose or mat-forming; bulbils in leaf axils or inflorescence. **LEAVES** alternate or basal. **INFL** of solitary flowers or modified cymes, often appearing racemose or open, variously branched. **FLOWERS** perfect, with or without hypanthium, sepals 5, erect to deflexed; petals 5, clawless or clawed, usually white, pink to purple, yellow, or with red spotting, deciduous or persistent; stamens 10, filaments petaloid, linear or flattened; ovary superior or partly to wholly inferior, carpels 2–5. **FRUIT** a capsule dehiscent across top, or follicle. **SEEDS** small, numerous.

1. Flower petals yellow; plants with spreading stolons from slender rhizomes ..... (2)
1′ Flower petals white to cream, or pink to purple, sometimes yellow ..... (3)

2. Plants with naked, spreading stolons; flowering stems to 15 cm, without leaves ..... ***S. flagellaris***
2′ Plants mat-forming, stolons absent; with numerous tufted-leafy, erect flowering stems to 20 cm ..... ***S. serpyllifolia***

3. Leaves all basal; flowering stems leafless, usually single, inflorescence a cyme ..... (4)
3′ Flowering stems with leaves, inflorescence open, of 1 to many flowers ..... (6)

4. Leaves circular in outline, cordate at the base; cymose panicle loose and open ..... ***S. odontoloma***
4′ Leaves lanceolate or broader, toothed or entire, tapering to a petiole; inflorescence a dense head or spike ..... (5)

5. Spikes usually simple, headlike in anthesis; leaves rhomboid, short; foothills to lower tundra ..... ***S. rhomboidea***
5′ Spikes usually compound; leaves elongate, narrowly oblanceolate; wet meadows and streamsides ..... ***S. oregana***

6. Low, mat-forming perennials; produced from branched woody caudex ..... (7)
6′ Plants from delicate caudex, often short-lived perennials ..... (8)

7. Plants covered with persistent sessile, rigid, entire, closely appressed leaves, imbricate at base, with setose tips, coarsely ciliate margins; flowering stems to 20 cm; petals white, 3.5–4.5 mm long, purplish red, with yellow or orange spots ..... ***S. bronchialis***
7′ Leaves mostly in crowded basal rosette, distinctly 3-lobed apically, densely pubescent, glandular-ciliate; flowering stems erect, to 15 cm; petals white or cream, not spotted ..... ***S. cespitosa***

8. Plants from slender caudex; flowering stems erect, 10–15 cm tall; 4–14 flowers; petals 7–16 mm long, white, occasionally pink, without colored spots ..... ***S. adscendens***
8′ Plants delicate, with lobed or toothed, petiolate leaves, blades to 15 mm long; flowering stems branched or not; 1–5 terminal flowers; petals white ..... (9)

9. Reddish bulblets present in the upper leaf axils; often along snow-runoff rivulets ..... ***S. cernua***
9′ Bulblets absent; alpine ..... (10)

10. Inflorescence with erect pedicels; pedicels with short, straight, glandular hairs; calyx lobes often shorter than the hypanthium; hypanthium narrowly campanulate ..... ***S. hyperborea***
10′ Inflorescence with spreading pedicels; pedicels with long, crinkly, glandular hairs; calyx lobes equaling or exceeding the hypanthium; hypanthium broadly campanulate ..... ***S. rivularis***

Saxifraga adscendens L. (ascending) Wedgeleaf saxifrage. Short-lived perennial, caulescent herb; herbage glabrous to densely pubescent. **FLOWERING STEMS** usually 1–few, 2–8 cm tall, unbranched; arising from basal rosette; strongly glandular-pubescent; leaves gradually tapering to broadly winged petiole-like base. **LEAVES**: basal leaves 5–15 mm long, sessile, wedgelike, deeply 3-lobed to palmately compound lobes, apically 2–5 acute teeth. **INFL** a 4–14-flowered, nodding raceme. **FLOWER** hypanthium long-obconic-elongate at anthesis, becoming elongate in fruit; pedicellate, sepals triangular; corolla widely spreading, petals white, occasionally pink, usually with prominent vein markings, 7–16 mm long, always 3-cleft; ovary inferior. **FRUIT** a capsule, 3–5 mm long. **SEEDS** smooth or wrinkled. [*Muscaria adscendens* (L.) Small]. Along streams; subalpine to alpine, tundra. COLO: Arc, Con, Hin, LPl, SJn. 3505–4145 m (11500–13600′). Flowering: Jul–Aug. British Columbia east to Alberta, south to Colorado and Utah.

Saxifraga bronchialis L. **CP** (windpipe; reference is unknown) Yellow dot saxifrage. Slender, perennial, caulescent herb. **FLOWERING STEMS** 1–several, 1.5–3 dm tall, unbranched, arising from basal rosette; leaves 2. **LEAVES**: basal leaves light green, sparsely pubescent, orbicular, short, petiolate, to 8 cm long, blade simple to irregularly 3–5-lobed to almost

pinnatifid; cauline leaves palmately compound, much reduced, more highly dissected than basal leaves, always appearing pinnatifid; stipules broad, fimbriate, decurrent on petiolar base. **INFL** a 3–12-flowered, compact racemose. **FLOWER** hypanthium campanulate or hemispheric, becoming elongate-campanulate in fruit, slightly pendulous; sepals triangular, valvate in bud, becoming widespread at anthesis; corolla widely spreading, open at throat; petals white to cream, with dark red spots in upper 1/2, yellow or orange spots in lower 1/2, ovate, 3–7 mm long; ovary less than 1/2 inferior. **FRUIT** a capsule 4–6 mm long. **SEEDS** smooth or wrinkled. (*Ciliaria austromontana* (Wiegand) W. A. Weber). Open rocky slopes and meadows; subalpine to alpine. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, Sln; 2530–3720 m (8300–12200'). Flowering: Jun–Sep. Alaska and Yukon south to Oregon, Idaho, and New Mexico. Our plants belong to **var. *austromontana*** (Wiegand) M. Peck (of southern mountains).

Saxifraga cespitosa L. (tufted) Tufted alpine saxifrage. Small, usually densely caespitose perennial from woody-branched caudex with taproot. **FLOWERING STEMS** caudex branches ascending, covered with densely imbricate leaves; scape erect, up to 25 cm tall, often densely glandular-pubescent. **LEAVES** mostly in a crowded basal rosette, narrowly cuneate with a broad petiole, almost always distinctly 3-lobed; cauline leaves 1–10 mm long, upper leaves progressively smaller, usually 3-lobed, bractlike. **INFL** a 1–5-flowered cyme, pedicels up to 10 mm long, glandular-pubescent. **FLOWER** sepals 1–3 mm long, erect to spreading, triangular, obtuse, glandular-pubescent, often purple; petals 1–5 mm long, obovate, gradually narrowed to broad base, only slightly clawed, with 3 veins, white or tawny; ovary inferior at anthesis. **FRUIT** a capsule to 7 mm long, more or less obovate, dark brown. (*Muscaria montivola* Small; *S. caespitosa* subsp. *exaratoides* var. *purpusii* Engl. & Irmsch.). Fell-fields and rocky slopes, subalpine and alpine tundra communities. COLO: Hin, LPl, Min, Mon, Sln; 3535–4235 m (11600–13900'). Flowering: Jul–Aug. Circumboreal, south to Nevada, Arizona, and New Mexico.

Saxifraga cernua L. (nodding) Nodding saxifrage. Delicate perennial herbs from fibrous root system. **FLOWERING STEMS** 1–3, erect, 10–20 cm tall, glandular-pubescent and viscid-villous, often rusty villous at base; leaves distributed along stem, more numerous, larger at base; upper leaves smaller, fewer lobes, entire, sessile. **LEAVES** basal leaves petiolate, arranged in loose rosette, blades wider than long, 4–20 mm wide, 3–15 mm long; petioles 5–9 cm long; leaf blades subrotund, 3–9-lobed; upper stem leaves reduced, entire at top of stem, bearing small clusters of red-purple to black bulbils in axils; basal leaves bearing cream-colored, ricelike bulbils at petiole base. **INFL** with 1–3 flowers produced at top, often only bulbils on the stem. **FLOWER** hypanthium up to 2 mm long, turbinate; petals 3–12 mm long, obovate-cuneate, rounded, not clawed, white with 3–5 pink or purple veins; ovary superior, only inferior at the base. **FRUIT** a capsule that rarely develops. Rocky talus. COLO: Hin, LPl, Sln; 3320–4265 m (10900–14000'). Flowering: Jul–Aug. Circumboreal, south to New Mexico.

Saxifraga flagellaris Willd. ex Sternb. (with flagella, referring to the stolons) Whiplash saxifrage. Stoloniferous perennial or biennial herbs from slender rhizomes; stolons leafless, up to 25 cm long, terminating in bud that develops roots and tufts of glandular-ciliate leaves. **FLOWERING STEMS** with solitary scapes, erect, to 15 cm long. **LEAVES** with a basal rosette; glandular-pubescent with purplish gland-tipped hairs; 5–20 mm long, 1–5 mm wide, obovate-oblanceolate to narrowly spatulate, acuminate, setose-tipped, entire, coarsely glandular-ciliate; cauline leaves numerous, similar to basal leaves, but reduced as produced up flowering stem. **INFL** of 1–3 flowers, occasionally more. **FLOWERS** with a showy, bright yellow corolla; pedicels 5–9 mm long, stipitate-glandular; sepals green to red-purple, oblong to lanceolate or ovate, 2–5 mm long, stipitate-glandular, glands purplish; petals 6–12 mm long, yellow, 7–9-veined, stamens longer than sepals, filaments subulate, ovary 1/4 inferior; hypanthium 1–4 mm long, turbinate-campanulate, completely adnate to ovary, acute to rounded, stipitate-glandular. **FRUIT** a capsule 4–8 mm long. **SEEDS** about 0.6 mm long, ovoid-lanceolate, nearly smooth, brown. (*Hirculus platysepalus* (Trautv.) W. A. Weber subsp. *crandallii* (Gand.) W. A. Weber). Alpine; tundra, krummholz, rocky; forbs, grasses. COLO: Con, Hin, LPl, Min, Mon, RGr, Sln; 3505–4205 m (11500–13800'). Flowering: Jun–Sep. Circumboreal, south to Arizona and New Mexico.

Saxifraga hyperborea R. Br. (extreme northern) Pygmy saxifrage. A loosely tufted and weak perennial. **FLOWERING STEMS** 4–14 cm tall, glabrous or nearly so. **LEAVES** with blades 6–17 mm wide, suborbicular or reniform, usually 5-palmately lobed; stem leaves lobed or entire, basal and lower cauline long-petioled. **INFL** of 1–3 flowers. **FLOWER** calyx tube 2.5–4 mm long; calyx lobes 2–3 mm long, shorter than the tube, ovate or oblong-ovate; petals 3–7 mm long, white, oblong, somewhat clawed at the base; ovary partly inferior. **FRUIT** a 5–7 mm long capsule. (*Saxifraga debilis* Engelm. ex A. Gray). Subalpine to alpine; usually in dry, shaded alcoves and under boulders. COLO: Con, LPl, Sln; 2895–4265 m (9500–14000'). Flowering: Jul–Aug. Montana south to Colorado and Utah. Our material belongs to **var. *debilis*** (Engelm.) Á. Löve, D. Löve & B. M. Kapoor (debilitated or weak).

Saxifraga odontoloma Piper (toothed margin) Brook saxifrage. Scapose perennial herb from stout, horizontal rootstock. **FLOWERING STEMS** with usually a single scape, 15–80 cm tall. **LEAVES** all basal, somewhat fleshy, glabrous, blades 1–10 cm wide and long, orbicular to reniform, cordate or truncate at base, margins coarsely dentate or crenate; petioles 2–3 cm long; leaves on scapes glabrous below, glandular above. **INFL** open-spreading, a several-flowered cyme, stipitate-glandular. **FLOWER** sepals 2–3 mm long, strongly deflexed in anthesis, purplish; petals 2–4 mm long, white, spreading; stamens equalling or exceeding petals. **FRUIT** a capsule 5–9 mm long. **SEEDS** 0.7–1.2 mm long, fusiform, weakly longitudinally ribbed, pale brown. [*S. arguta* D. Don, misapplied; *Micranthes odontoloma* (Piper) W. A. Weber]. Often along stream banks, meadows, and seeps; subalpine and alpine communities. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; UTAH. 2775–3870 m (9100–12700'). Flowering: Jul–Sep. Alaska south to California, east to Alberta, and south to New Mexico.

Saxifraga oregana Howell (of Oregon) Oregon saxifrage. Scapose perennial herbs from a stout, fleshy, simple caudex, often rhizomatous. **FLOWERING STEMS** scapose, single, 20–120 cm tall, pubescent with white hairs tipped with yellow or pink to red viscid glands. **LEAVES** all basal, thick, somewhat succulent; petiole tapering gradually, broad-oblanceolate, sinuate-denticulate margin, up to 20 cm long, up to 7 cm wide. **INFL** a many-branched, glandular-pubescent cyme, 20–200 flowers in loose clusters or heads. **FLOWER** hypanthium turbinate to cupulate, completely adnate to ovary; pedicels 0.5–4 mm long; sepals 1.2–3 mm long, usually deflexed, deltate-ovate, obtuse, glabrous, green; petals 1.5–4 mm long, 0.5–2.5 mm wide, deciduous, usually clawless, white; filaments 1–2 mm long, inserted at edge of disc, white, greenish white, or purplish; anthers 0.5–0.7 mm long, pale orange. **FRUIT** a follicular capsule, usually up to 7 mm long, green to purplish. **SEEDS** 1 mm long, ellipsoid. [*Micranthes oregana* (Howell) Small]. Talus, meadows, and streamsides; subalpine to alpine. COLO: SJn. 3655–3960 m (12000–13000'). Flowering: Jul–Aug. Washington and Oregon, south to California, east to Montana, and south to Colorado.

Saxifraga rhomboidea Greene (diamond-shaped) Diamond leaf saxifrage. Scapose perennial herbs to 30 cm tall from short rootstock, fibrous roots. **FLOWERING STEMS** usually single, sometimes several, with scapes 3–30 cm tall, upper definitely glandular-pubescent. **LEAVES** all basal, petioles 0.3–2.5 cm long, usually pilose-ciliate fringed, broad, flattened, gradually transposed into blade, blades 9–35 mm long, 3–20 mm wide, rhombic, obovate, or ovate, dentate or crenate to entire, not lobed, glabrous or ciliate. **INFL** cymose-paniculate, globose, densely congested; glandular; 10–40 flowers. **FLOWER** hypanthium adnate to ovary; sepals 1–2 mm long, triangular, not reflexed; petals 2–4 mm long, white; stamens longer than sepals, subequal to petals. **FRUIT** a follicular capsule 4–6 mm long. **SEEDS** less than 1 mm long, ellipsoidal, wrinkled longitudinally. [*Micranthes rhomboidea* (Greene) Small]. Meadows; ponderosa pine, Douglas-fir, spruce-fir, and alpine communities. ARIZ: Apa; COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn; NNEX: McK, SJn; UTAH. 2590–3750 m (8500–12300'). Flowering: May–Sep. British Columbia south to New Mexico.

Saxifraga rivularis L. (from a streamside) Bract saxifrage. Small, delicate, perennial herb from a fibrous root system; herbage often somewhat reddish. **FLOWERING STEMS** 1–several, erect, up to 15 cm tall, simple to sparingly branched, glabrous or sparsely to densely pubescent. **LEAVES** flabelliform to reniform, blades 3–8 mm long, 5–15 mm wide, 3–7-lobed, base cuneate to subcordate; petioles slender, 5–45 mm long, cauline leaves often reduced, entire; basal leaves sometimes bearing cream to brownish, ricelike bulbils in axils; cauline leaves more numerous at base, reduced, broadly ovate to lanceolate, 3–5 (–7) lobes to entire, bractlike. **INFL** a raceme; 1–5 flowers. **FLOWER** hypanthium 1–1.4 mm long, 2–3 mm wide at anthesis, glandular-puberulent; sepals oblong-ovate, 2–2.5 mm long, acute or rounded at apex; petals white to pale rose, sometimes purplish, 3–5 mm long. **FRUIT** an ovoid capsule 4–5 mm long, glabrous, strongly nerved. **SEEDS** dark brown to dark gray, 0.3–0.5 mm long, testa wrinkled, minutely reticular-foveolate. Often near melting snowbanks; talus slopes and meadows; Engelmann spruce and alpine communities. COLO: Arc, Con, Hin, LPl, Min, Mon, RGr, SJn. 2960–4220 m (9715–13840'). Flowering: Jul–Oct. British Columbia south to California, east to Montana and Arizona.

Saxifraga serpyllifolia Pursh (thyme-leaved) Gold bloom saxifrage. Low, tufted, perennial plant from slender rhizomes. **FLOWERING STEMS** 1–7 cm tall, glandular-pubescent, hairs often purple-tipped. glabrous or glandular when present. **LEAVES**: basal leaves mostly fleshy, pubescent above, glabrous below; 4–12 mm wide, linear-oblanceolate to narrowly spatulate, rounded, entire, glabrous; 1–3 cauline leaves may be lacking, but occasionally 1–5, alternate. **INFL** 1–3-flowered; peduncle 5–25 mm long, glandular-pubescent. **FLOWER** hypanthium short, adnate to ovary; sepals 2–4 mm long, becoming sharply deflexed, ovate, rounded, externally pubescent; petals 4–8 mm long, 2–5 mm wide, orbicular to broadly obovate, narrowed to a short claw; 5–9-nerved, golden yellow, often darker at base when aged; stamens inserted around edge of ovary, longer than sepals but shorter than petals; ovaries slightly inferior. **FRUIT** a capsule 6–8

mm long, ovoid. **SEEDS** 1 mm long, reticulate-wrinkled [*S. chrysantha* A. Gray, *Hirculus serpyllifolius* (Pursh) W. A. Weber subsp. *chrysanthus* (A. Gray) W. A. Weber]. Fell-fields, rock stripes; alpine tundra communities. COLO. Sln. 3200–4115 m (10500–13500'). Our material belongs to **var. *chrysantha*** (A. Gray) Dorn (yellow-flowered). Wyoming south to New Mexico.

SCROPHULARIACEAE Juss. FIGWORT FAMILY

(ALSO SEE OROBANCHACEAE, PHRYMACEAE, and PLANTAGINACEAE)

J. Mark Porter

Annuals and perennials, herbs (ours) or shrubs. **LEAVES** opposite, the petioles sometimes connate, or alternate, sometimes whorled or largely basal, without stipules or with stipulelike structures, simple to dissected. **INFL** raceme or spike, bracts foliaceous to reduced. **FLOWERS** perfect; calyx of 4 or 5 distinct or united sepals, regular or irregular; corolla sympetalous, actinomorphic to evidently zygomorphic, 4- or 5-lobed, often 2-lipped, tubular, campanulate or sometimes rotate, rarely wanting; stamens epipetalous, often 4, or 4 fertile and 1 sterile (referred to as a staminode, e.g., *Scrophularia*), rarely 5 fertile (*Verbascum*), alternate with the corolla lobes, anthers 2-celled with equal cells; ovary superior, 2-carpelled, 2-locular, the anatropous ovules on axile placentae; style solitary and entire, capitate or flattened. **FRUIT** a capsule (ours), dehiscence septicidal, sometimes loculicidal at the apex, or both (4-valved), berry, drupe, or schizocarp. **SEEDS** usually many and small, rarely few, wingless or winged; the embryo small, endosperm abundant or absent. $n = 6$ or more. Scrophulariaceae sensu stricto includes 65 genera and about 1700 species. However, only *Scrophularia* and *Verbascum* occur in our area. The traditional circumscription of Scrophulariaceae sensu lato (see for example the floras of Harrington, McDougall, Martin and Hutchins, and Weber) includes many genera that are not particularly close in their relationship to one another. In fact, some are far more closely related to other well-recognized families than they are to the genus *Scrophularia*, where the family name is attached. Within the context of our flora, members of Scrophulariaceae sensu lato are placed into four families: Orobanchaceae (7 genera), Phrymaceae (1 genus), Plantaginaceae (13 genera), and Scrophulariaceae (sensu stricto, 2 genera) (Olmstead et al. 2001; Oxelman et al. 2005).

1. Corolla globular to urceolate; fertile stamens 4, staminode flattened, scalelike; leaves opposite, rarely subopposite; inflorescence an elongate thyrsoid panicle ..... ***Scrophularia***
1' Corolla rotate; fertile stamens 5, staminode absent; leaves alternate on the stem and clustered in a basal rosette; inflorescence a congested spikelike panicle ..... ***Verbascum***

Scrophularia L. Figwort

(Latin *scrofula*, a rare disease characterized by swelling of the neck glands, reputedly cured by a European species of *Scrophularia*.) Perennial herbs or rarely shrubs. **STEMS** quadrangular. **LEAVES** opposite, decussate, petiolate; the blades irregularly serrate or divided, lanceolate to triangular-ovate. **INFL** a thyrsoid panicle, bracts lanceolate, reduced; alternate or subopposite, shorter than pedicels. **FLOWERS** small; calyx deeply and subequally 5-parted, the lobes broad, obtuse to rounded; corolla greenish yellow or greenish purple to dark reddish brown, the tube globular or urceolate, bilabiate, the upper lip 2-lobed, flat, erect, external in bud, the lower lip shorter, with erect lateral lobes and a deflexed middle lobe; staminode (sterile filament) flattened, narrowly clavate to broadly fan-shaped (in ours), attached to the corolla on the distal, upper tube, appressed; fertile stamens 4, the anthers 1-celled, usually included at the throat, filaments attached at the tube base (proximally); stigmas united, capitate. **FRUIT** a septicidal capsule, the walls firm. **SEEDS** many, oblong-ovoid, turgid, furrowed. $2n = 18, 20, 24, 26, 36, 40$. A genus of 150–200 species, mostly Eurasian, but also in New World temperate and tropical regions. Ten species are native to North America, one occurs in our area (Shaw 1962).

Scrophularia lanceolata Pursh (armed like a spear, pointed, referring to the leaf shape). Lanceleaf figwort. Perennial herb, glandular-puberulent. **STEMS** 80–150 cm tall, clustered. **LEAVES** with petioles 2–4 cm long; blades 8–14 cm long, 3.5–7 cm wide, lanceolate to lance-ovate, apex acuminate, base rounded, truncate or cordate, serrate. **INFL** a narrow, elongate panicle. **FLOWER** calyx 2–3.8 mm long, the lobes ovate to broadly rounded, the margins scarious and slightly erose; corolla 8–14 mm long, pale reddish brown or greenish brown, the tube urceolate, throat slightly constricted; staminode fan-shaped, 1–2 mm wide, wider than long, yellow-green, sometimes purplish; anthers 0.8–1.1 mm wide. **FRUIT** a capsule, 5.5–10 mm long, ovoid, acuminate. **SEEDS** 0.8–0.9 mm long. $2n = 92, 96$. Semimoist stream banks, thickets, woods, roadsides, and fencerows; sagebrush, aspen, and spruce-fir. ARIZ. Apa. COLO. Arc. Hin.

LPl, Min, Mon; NMEX: RAr; UTAH. 1400–2800 (3300) m (4600–10800'). Flowering: Jun–Jul. Fruit: Jul–Aug. Southern British Columbia, Washington, Oregon, and northern California (mostly east of the Cascade Range), east across northeast Nevada, and through Idaho, Utah, Montana, Wyoming, Colorado, and northern New Mexico to the northeastern United States.

Verbascum L. Mullein

(*barbascum*, ancient name used for some species) Biennial or perennial, taprooted herbs, or rarely small shrubs. **STEMS** tall, coarse, simple or branched. **LEAVES** basal and/or cauline, basal ones forming a rosette, the cauline alternate, simple, sessile, clasping or somewhat decurrent, pinnately veined. **INFL** a raceme, spike, or congested panicle; bracts reduced. **FLOWER** calyx deeply 5-parted, the lobes equal; corolla, ours usually yellow, sometimes white or occasionally purple, rotate, slightly irregularly 5-lobed, the upper 2 lobes external in bud and slightly shorter than the lower 3, the tube very short; stamens 5 and usually all anther-bearing, the filaments usually villous and more or less alike, or the lower pair glabrous to sparsely hairy; anthers 1-celled; staminode absent; style flattened distally, the stigmas united and capitate. **FRUIT** a septicidal capsule, walls firm, ovoid to globose. **SEEDS** numerous, densely packed around the placentae, ours obconic, with thick, sinuous, longitudinal ribs which sometimes anastomose, forming areolas. $2n$ = 30, 32, 36. A large genus of about 360 species, occurring chiefly in southeastern Europe and southwestern Asia. Several species have been introduced and naturalized in North America, including our only representative.

Verbascum thapsus L. (long) Common mullein, woolly mullein, wupaviva (Hopi). Stout biennial, producing a rosette of leaves the first year and a tall, stout, flowering stem the second, 30–200 cm tall. **STEMS** erect, winged by the decurrent leaf bases; densely yellow-tomentose with stellate or dendritic hairs. **LEAVES**: basal 8–50 cm long, 2.5–14 cm wide, oblanceolate to obovate, obtuse, tapering to a petiolate base, entire to shallowly crenate, sometimes persisting for 2 years; cauline leaves progressively reduced upward, sessile, decurrent, oblanceolate. **INFL** a compact spikelike panicle; pedicels very short. **FLOWER** calyx (5) 8–12 mm long, the segments lanceolate; corolla 12–30 (35) mm in diameter, yellow or rarely white, the lobes scurfy-pubescent on back, sometimes ciliate with stellate hairs; stamens of 2 distinctly dissimilar types, the lower 2 with glabrous to sparsely villous filaments and decurrent anthers, the upper 3 with yellow-villous filaments. **FRUIT** capsule 7–10 mm long, broadly ovoid, densely tomentose with stellate or dendritic hairs, becoming scurfy at maturity. **SEEDS** 0.7–0.8 mm long. $2n$ = 32, 34, 36. Moist, gravelly roadsides and waste places; sagebrush, piñon-juniper, ponderosa pine, and spruce-fir. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1220–2810 m (4000–9200'). Flowering: Jun–Jul. Fruit: late June–Aug. A native of Eurasia, but naturalized throughout most of temperate North America. Leaves were gathered by the Hopi, then dried and smoked in combination with *Macromeria viridiflora* A. DC. to treat mental disturbances.

SIMAROUBACEAE DC. QUASSIA FAMILY

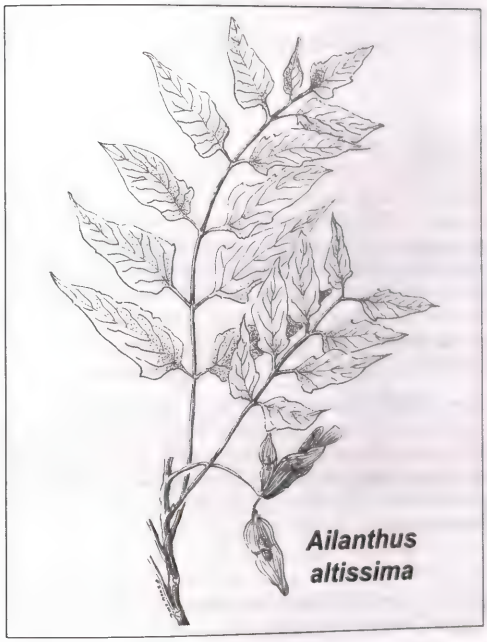
Linda Mary Reeves

Primarily trees or shrubs, often dioecious, most herbage with bitter quassinoids. **LEAVES** alternate, rarely opposite; pinnately compound, rarely simple. **INFL** a raceme, panicle, or solitary. **FLOWERS** perfect or imperfect, actinomorphic; sepals 3–8, often connate; petals 3–8, often connate; disc present; stamens numerous, usually twice as many as petals; styles 2–5; carpels 2–5, often partially connate, ovary superior. **FRUIT** a capsule, often schizocarpic, drupe or samara-like. x = 8–13+. About 25 genera, 150 species, primarily tropical and subtropical. Several species important medicinally, especially *Quassia* and *Picramnia*. *Simarouba glauca*, tree-of-paradise, is a native of the U.S. (Florida).

Ailanthus Desf. Tree of Heaven

(Moluccan name meaning tree of heaven) Trees or large shrubs; polygamodioecious; bark gray. **LEAVES** deciduous, mostly large, odd-pinnately compound, pungent when crushed. **INFL** a large, terminal panicle. **FLOWERS** often pungent; calyx lobes 5–6; petals 5–6; stamens 10–12 in staminate flowers, 2–3 in perfect flowers; ovary 2–5-lobed. **FRUIT** samara-like, 1–5 per flower, 1 per carpel, pendulous. About 15 species, primarily eastern Asia and northeastern Australia.

Ailanthus altissima (Mill.) Swingle (very tall) Tree of heaven, homestead tree, copal tree. Slender polygamodioecious tree or large shrub rapidly gaining height to 20 m tall, often in thickets of clones from rhizomes. **STEMS** green, glandular-puberulent, bark smooth, wood soft, with large pith. **LEAVES** glandular-puberulent; dark green with light, prominent venation; 10–100 cm long; leaflets 9–31, 5–15 cm long, elliptic-oblong to lanceolate, acuminate, often falcate, with 1–6 large glands on basal lower margin. **INFL** 10–40 cm long. **FLOWERS** small, greenish to whitish or yellowish; staminate flowers malodorous; calyx less than 1 mm long; petals 2–3 mm long, enfolded with woolly pubescence on



or near margin; disc lobed; filaments basally pubescent; ovary 2–5 flat, unicarpellate sections. **FRUIT** samara-like, 3–5 cm long, 3–7 mm wide, linear, curved or oblique at base, seed near the center. $2n = 64$. *A. glandulosa* Desf.] Weedy cultivated tree, escaped near buildings, in alleyways, vacant lots, and persisting at old homesteads and mine sites. ARIZ: Nav; COLO: LPl, Mon; NMEX: McK, Sln; UTAH: 1300–2000 m (4400–6500'). Flowering: May–Jul. Fruit: Jun–Jul. Extensively planted in the United States and Canada from Ontario and Maine south and west to Florida, Washington, and California, commonly escaping, weedy and persisting. Native to China. Resistant to pollution and extremely hardy even in dry conditions. The starring plant in the play *A Tree Grows in Brooklyn*.

SOLANACEAE Juss. POTATO FAMILY

William J. Litzinger

Annual, biennial, perennial herbs or shrubs, glabrous to strongly pubescent. **LEAVES** simple or sometimes pinnately divided, alternate (though may become subopposed in the inflorescence), estipulate, usually petioled. **INFL** determinate cymose, axillary to extra-axillary, often reduced to a few or solitary flowers in the axils. **FLOWERS** usually actinomorphic to slightly zygomorphic, perfect, hypogynous, often showy, (4) 5 (7) to numerous; calyx sympetalous with usually 5 lobes or teeth, persistent and often enlarging in fruit; corolla sympetalous with usually 5 lobes, rotate, funnelform or salverform, variously colored, plicate or convolute; androecium of 5 stamens, alternate with the corolla lobes, epipetalous; filaments distinct; anthers basifixed, sometimes connivent, sometimes with enlarged connective, equal or unequal, dehiscing longitudinally or by apical pores or both; gynoecium of 1 pistil, 2-carpellate, ovary superior, 2-locular (or sometimes falsely 3–5), often surrounded at base by a fleshy disc, ovules numerous, anatropous to campylotropous, placentation axile or basal; style single; stigma 2-lobed. **FRUIT** a fleshy to dry berry, sometimes enclosed in a persistent inflated calyx, or capsule. **SEEDS** numerous, flattened and discoid, smooth to pitted or reticulate, endosperm copious, fleshy; embryo straight or bent. $x = 7–12$. Cosmopolitan, with approximately 75 genera and over 3000 species; most abundant in Central and South America. The family is important worldwide for humans as food, medicines, ornamentals, and narcotic and toxic plants. Many are invasive, weedy plants that have greatly extended their range by human activity. Use of plants in this family is extensively documented in the contemporary and historic ethnobotanical literature of Southwestern indigenous peoples. Remains, especially charred seeds, of several species in this family are frequently reported from archaeological excavations.

1. Woody shrubs; fruit fleshy or dry and bony; corolla funnelform ..... ***Lycium*** (2)
1' Herbaceous annuals, biennials, or perennials; fruit various; corolla various ..... ***Datura*** (3)
2. Flowers large, over 10 cm long, white ..... (3)

7' Flowers solitary or axillary ..... ***Petunia***

Chamaesaracha (A. Gray) Benth. False Nightshade

(*chamae*, on the ground, + *saracha*, for Isidore Saracha, a Spanish monk) Rhizotamous to taprooted herbaceous perennial. **STEMS** decumbent, branched from base. **LEAVES** entire to deeply pinnately lobed, scarcely to densely pubescent, hairs simple, dendritic, or stellate, sometimes gland-tipped, with margined petioles. **INFL** in axillary clusters, 1–2 (4)-flowered. **FLOWERS** small, 5-lobed; calyx sometimes accrescent and closely investing and partially to largely concealing the fruit; corolla rotate, white to yellowish to greenish; androecium sometimes purple-tinged, glandular to velvety tomentose in fornices between stamens; anthers free, yellow, generally smaller than the slender, terete filaments, dehiscing by lengthwise slits; gynoecium with style 1. **FRUIT** a small, usually whitish, rather dry berry, spheric, seed-bearing only on the basal part of the placentae. **SEEDS** more or less flat, reniform, strongly alveolate to rugose-favose, the embryo curved. About nine species, especially in the southwest United States and Mexico.

Chamaesaracha coronopus (Dunal) A. Gray (horny base) **STEMS** many from base, 10–50 cm long; decumbent or prostrate, especially when young or grazed, when protected becoming more erect at maturity, hairs becoming sparse with age, eglandular, branched and mostly stalked; sessile to subsessile. **LEAVES** (1) 2–6 (15) mm wide, oblong-lanceolate to linear, entire to deeply lobed, margin sinuate-dentate. **INFL** with pedicels ± 1 cm, in fruit 2 cm, reflexed. **FLOWER** calyx 3–5 mm, in fruit 5–10 mm, lobes deltoid, about equal to the corolla tube, in fruit 2 mm, strongly pubescent, the hairs varying from all stellate and either sessile or stalked, to all elongate and simple, or often mixed; corolla greenish white, sometimes dull purplish speckled, the fornices white-tomentose, anthers (1.5) 2 mm long. **FRUIT** 5–8 mm wide, with calyx closely enclosing except at the top. **SEEDS** about 2.5 to 3 mm long, very prominently rugose-favose. $2n = 48, 72$. Blackbrush and desert scrub communities; weedy. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: McK, SJn; UTAH. 1125–1830 m (3700–6000'). Flowering: Apr–Jul. California to Texas, Colorado, Kansas, and New Mexico.

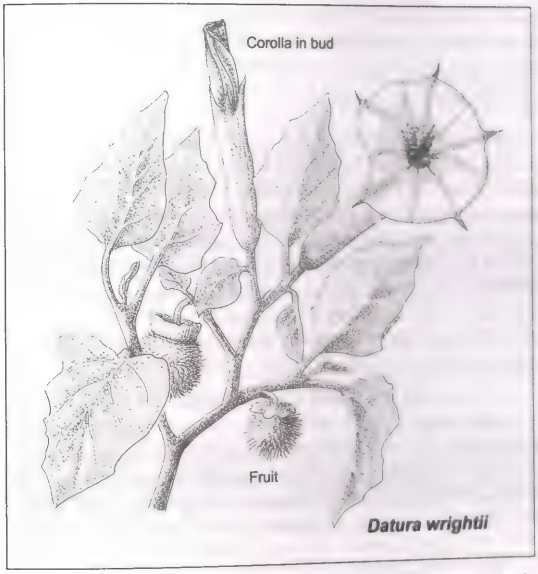
Datura L. Jimsonweed, Thorn-apple

(ancient Hindu name) Coarse, rank-smelling herbs. **STEMS** erect or spreading. **LEAVES** alternate, short-petioled, entire to sinuate-dentate or lobed. **FLOWERS** solitary, large, 8–20 cm long, erect on short peduncles in the forks of branching stems, green-tinged when plicate, opening whitish purple to violet, opening in the evening at least in some species; calyx tubular, 5-toothed, circumscissile near the base in ours, with the lower part persistent as a collar below the capsule; corolla funnelform, convolute-plicate in bud; stamens included in ours, filaments filiform, the anthers dehiscent by lateral slits, stigma 2-lobed; ovary 2- or falsely 4-celled. **FRUIT** in ours a spiny capsule, dehiscing irregularly. **SEEDS** numerous, large. About 25 species, in warmer parts of all continents. The plants are poisonous and have narcotic properties. Extensively used by indigenous peoples of the Southwest and worldwide.

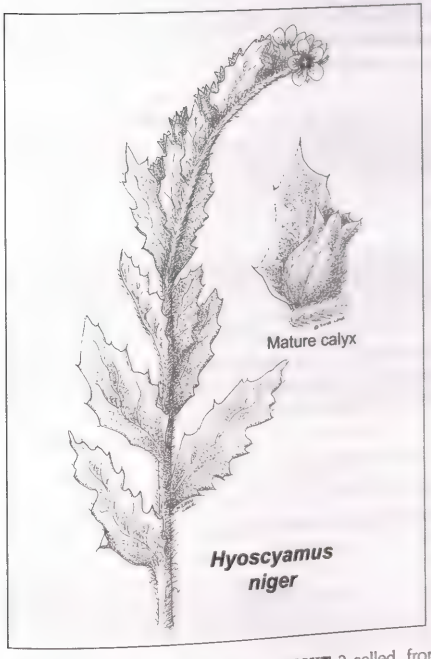
1. Fruit erect; flowers 5–10 cm long; annual ..... ***D. quercifolia***
1' Fruit pendent; flowers mostly longer than 10 cm; perennial ..... ***D. wrightii***

Datura quercifolia Kunth (oak leaf) Oak-leaved thorn-apple. Annual, glabrate to pubescent. **LEAVES** ovate, 6–16 cm long, 3–6 cm wide, the upper surface glabrescent, the lower surface pubescent, mostly along veins, acute, pinnately lobed, lobes often toothed; base cuneate to subcordate; petioles sometimes as long as or longer than the blade. **FLOWERS** with calyx 1.5–4 cm long, teeth acute to acuminate, 2–6 mm long; corolla white, light violet to purple, tube 3.8–7.7 cm long, the limb 1–2 cm wide. **FRUIT** erect, dehiscing along 4 sutures to base, green, ovoid to ellipsoid, 3–4.5 cm long, terminal spines 2–3.5 mm long; pericarp glabrate to puberulent. **SEEDS** reniform to discoid, 3–4.5 mm long, 2.5–3.5 mm wide, rugose. Roadsides and waste ground. NMEX: SJn. 1675–1830 m (5500–6000'). Flowering: May–Oct. Southeast California, southern Arizona, New Mexico, and Texas south to central Mexico.

Datura wrightii Regel **CP** (for Charles Wright, botanical explorer of the Southwest) Perennial erect herb. **STEMS** widely branched, 0.5–1.5 m tall and broad, minutely grayish pubescent throughout with fine, eglandular, more or less crisp hairs less than 0.2 mm long, the underside of leaves somewhat velvety to touch. **LEAVES** unequally ovate, (4–) 12–20 (25) cm long, irregularly repand to subentire, on somewhat short petioles. **INFL** 1-flowered, in the forks of branching stems, erect, becoming downturned in fruit. **FLOWERS** open in the early evening and usually persist for 1 day; calyx 7–10 cm long, initially enclosing the corolla, teeth initially connivent and somewhat plicate to convolute in bud, the



Datura wrightii



Hyoscyamus niger

persistent base usually rotate, sometimes reflexed; corolla green in bud, opening to white, suffused with violet, (8) 12–20 cm long, corolla teeth becoming tendril-like. **FRUIT** a capsule, nodding, 2.5–3 cm, densely spiny and usually puberulent, with irregular dehiscence; spines 5–12 mm long. **SEEDS** subreniform, buff to light brown, about 5 mm long, flattened, smooth, with a cordlike margin. $2n = 24$. [*Datura metel* L. var. *quinquecuspida* Torr.; *Datura meteloides* Dunal. Blackbrush, desert scrub, sagebrush, and pinon-juniper woodland communities. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: McK, SJn; UTAH: 1125–2070 m (3700–6800'). Flowering: May–Oct. Utah, Colorado, California to Texas, and northern Mexico.

Hyoscyamus L. Henbane

(*hys*, sow, + *kyamos*, bean) Annual or biennial herbaceous plants. **STEMS** leafy. **LEAVES** alternate, lobed or pinnatifid. **INFL** solitary in the upper axils and in terminal racemes, these more or less 1-sided to helicoid. **FLOWER** calyx urn-shaped to campanulate, 5-cleft, enlarging and becoming more or less reticulate in fruit, enclosing the capsule; corolla greenish yellow to whitish with dark rose or purple veins, funnelform, with slightly oblique 5-lobed limb; stamens exserted, anthers opening by longitudinal slits; ovary 2-celled, stigma capitate. **FRUIT** a capsule, circumscissile above the middle, included in the calyx. About 15 species in Europe, North Africa, to southwest and central Asia.

Hyoscyamus niger L. (black) Black henbane. **STEMS** 30–100 cm tall, stout, viscid short-villous. **LEAVES** 6–20 cm long, oblong-ovate to lanceolate, irregularly lobed, cleft, or pinnatifid, sessile to upper clasping, viscid and short-villous. **FLOWER** calyx 2–2.5 cm long in fruit; corolla mostly 1.5–2 cm long. **FRUIT** a capsule 10–14 mm long. A weed of roadsides and waste places in piñon-juniper woodland communities. NMEX: SJn, 1970 m (6000'). Flowering: Jun–Aug. Naturalized from Europe and widespread in North America. All parts of the plant are poisonous.

Lycium L. Wolfberry, Box-thorn

(named for Lycia, in Asia Minor) Armed shrubs, erect or spreading, sometimes scrambling over supports. **LEAVES** often fascicled, entire to minutely dentate, glabrous and glaucous to glandular or pubescent, fleshy in some. **FLOWERS** solitary or 2–4 in the axils; calyx campanulate to tubular, commonly ruptured by the fruit; corolla whitish to purplish or greenish purple, regular, tubular to funnelform, 4–6-lobed, anthers affixed near their middle. **FRUIT** 2-celled, from dry and bony to fleshy and juicy. **SEEDS** 2 many, embryo coiled. About 100 species of temperate to tropical zones; dry to humid regions.

1. Corolla tube less than 2.5 mm ..... ***L. andersonii***
1' Corolla tube greater than 2.5 mm ..... (2)

2. Corolla tube 4–7 mm; uncommon; spreading or viny, of waste places ..... ***L. barbatum***
2' Corolla tube greater than 12 mm; widespread; low shrub-forming colonies ..... ***L. pallidum***

Lycium andersonii A. Gray (for Frederick W. Anderson, botanist) Water jacket. Plants glabrous or subglabrous, branches armed, stiffly spreading to erect, spreading. **LEAVES** (1) 2–15 (20) mm, more or less linear, more or less ternate, fleshy. **FLOWER** calyx 1.5–3 mm, cup-shaped, lobes (2) 4–5, from 1/4 to nearly as long as the tube; corolla narrowly funnelform, white to yellowish, with lobes often bluish purple to violet-tinged, tube slender, 5–10 mm, the lobes (4) 5, 1–1.5 mm long, ciliate to glabrous; androecium with stamens more or less included to slightly exserted, unequal, attached at 1/3 from base, hairy on the free base; gynoecium with style equaling to slightly exceeding the stamens. **FRUIT** 3–8 mm, red or orange, juicy. **SEEDS** several to many, about 1.5 mm long. Blackbrush, desert scrub, sagebrush, and piñon-juniper communities; sandy washes and rocky slopes. ARIZ: Nav; UTAH. 1125–1525 m (3700–5000'). Flowering: Mar–May. California to southern Nevada and Utah, western New Mexico south to Mexico.

Lycium barbarum L. (foreign or strange) Matrimony vine. Plants glabrous, usually armed but may be unarmed, the thorns short if present, branches curved or arched, recumbent or climbing shrubs. **LEAVES** 2–6 cm, lanceolate to oblanceolate. **FLOWER** calyx 3–4 mm, bell-shaped, lobes (1) 2–3 long; corolla rotate-campanulate to short-funnelform, purple to lavender, lilac, rose-tinged, fading tan, tube 4–6 mm, abruptly expanded to the throat, lobes generally spreading; stamens unequal, attached at the middle of the tube, hair-tufted at base. **FRUIT** about 1 cm, fleshy, bright salmon-red. **SEEDS** 10–20. $2n = 24$. Gardens, escaping along roadsides, and old homesites. [*L. halimifolium* Mill.]. COLO: LPl, Mon. 1525–2135 m (5000–7000'). Flowering: Mar–Oct. An escaped cultivar found widely in North America; native to Eurasia. *L. chinense* Mill. is another cultivated species that may be expected in our area. It has corolla tubes with shorter lobes that are more or less hidden by the calyx.

Lycium pallidum Miers (pale) Pale wolfberry. Intricately branched shrub, 1–2 m tall, upright, but with spreading branches, rhizomatous, forming clonal clumps or "stands" of several to many square meters. **STEMS**: young stems glabrous to sparsely pubescent, maturing to reddish or silver-gray, the older bark becoming fissured. **LEAVES** 1–4 cm long, strongly glaucous when young, green, glabrous, in fascicles on older branches, alternate on new growth. ovate-elliptic, oblong-oblanceolate to oblong-spatulate to lanceolate, upper leaves often lanceolate. **FLOWER** calyx 5–8 mm long, the lobes as long as or longer than the tube; corolla 15–25 mm long, plicate in bud, narrowly funnelform, sometimes slightly lipped, greenish or tinged with purple, sometimes slightly reticulately purple-veined, fading tan; stamens usually slightly exserted, 1–2 mm. **FRUIT** about 1 cm wide, glaucescent, red to reddish blue, rarely yellow, ovoid to nearly pyriform. **SEEDS** 2–many. $2n = 24$. Blackbrush, desert scrub, piñon-juniper, and ponderosa pine communities. ARIZ: Apa, Coc, Nav; COLO: LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1220–1875 m (4000–6150'). Flowering: Mar–May. California through southern Nevada, southern Utah, Colorado, to southwest Texas and south to Mexico. Our material belongs to **subsp. *pallidum***. Pale wolfberry shows considerable variability, including forms with gray or reddish stems at maturity; forms that have fleshy leaves rather than the more common thin leaves; forms with distinctly zygomorphic flowers and calyces that are open on one side, cupping the flower and fruit; and forms with reduced numbers of seeds, typically 1–8, and occasionally seedless. Pale wolfberry flowers infrequently or may flower but not produce viable seed; it exhibits masting behavior, producing abundant fruit crops in cycles of (1) 3–7 or more years. It is frequently found on prehistoric Pueblo archaeological sites, near old sheep camps, animal pens, and along roadsides where it appears to reproduce by spreading rhizomes, often aggressively invading graded or heavily disturbed areas from existing stands. Occasionally it is found in large stands covering several hectares.

Nicotiana L. Tobacco

(for Jean Nicot, French ambassador to Portugal who introduced tobacco into France) Heavy-scented annual or perennial herb, usually viscid-pubescent. **LEAVES** large, alternate, entire or repand. **INFL** in terminal panicles or racemes. **FLOWER** calyx tubular-campanulate or ovoid, 5-cleft, persistent; corolla funnelform, salverform, or nearly tubular, the limb usually shallowly 5-lobed and spreading; filaments filiform; ovary 2 (4)-celled. **FRUIT** a capsule, 2- or 4-valved at summit. **SEEDS** many, small, ovoid to reniform, minutely reticulate-punctate. Approximately 60 species, mostly in North and South America, some important in commerce and for ornamentals.

1. Annual; may have glandular hairs, but not viscid-villous; all leaves petioled, never hastate ..... ***N. attenuata***
1' Perennial; viscid-villous throughout; lower leaves petioled, upper hastate ..... ***N. obtusifolia***

Nicotiana attenuata Torr. (weak or meager) Mountain tobacco. Annual herb, erect, simple or branched, glandular-pubescent to glabrate, 30–200 cm tall. **LEAVES** 5–15 (25) cm long, ovate to lanceolate-ovate, mostly petioled. **INFL** in a raceme or panicle. **FLOWERS** about 2.5–3 cm long; calyx ovoid-campanulate, 6–8 mm long, the teeth deltoid; corolla white to cream to reddish, often infused with purple, sometimes purple-banded or with a green tube and white lobes. **FRUIT** a capsule, about 8–12 mm long, rarely to 20 mm. Solitary or in dense populations in disturbed sites, roadsides, abandoned fields, and for 1–3 years after fires. ARIZ: Apa, Coc, Nav, COLO, LPl, Mon, NMEX, McK, RAr, San, SJn; UTAH. 1220–2285 m (4000–7500'). Flowering: Jun–Sep. Used by aboriginal peoples for smoking. British Columbia to northern Baja California, Mexico; Idaho to Texas and northern Mexico.

Nicotiana obtusifolia M. Martens & Galeotti (blunt-lobed) Desert tobacco. Perennial herb, viscid-pubescent, 20–50 cm tall, erect, simple or few-branched. **LEAVES**: lower petioled, upper ovate to lanceolate, sessile and auricled, 2–8 cm long. **INFL** loosely paniculate or racemose, pedicels 5–10 mm long. **FLOWER** calyx 6–12 mm long, campanulate, with lanceolate-subulate lobes approximately as long as the corolla tube; corolla greenish white, 18–22 mm long, constricted at orifice, the limb 8–10 mm, broad, sometimes slightly zygomorphic. **FRUIT** a capsule, 2-valved, 8–10 mm long. **SEEDS** dark brown, about 0.6 mm long. [*N. trigonophylla* Dunal] Cliff faces, in rocks, along arroyos in blackbrush and desert scrub communities. ARIZ: Nav; UTAH. 1125–1220 m (3700–4000'). Flowering: Mar–Nov. California, Arizona, Utah, and New Mexico to Texas and northern Mexico.

Petunia Juss. Petunia

(*petun*, name for tobacco) Viscid annual or perennial herb. **LEAVES** entire, the upper often subopposed. **INFL** terminal, solitary, or axillary. **FLOWER** calyx 5-parted, 10-nerved; corolla funnelform, minute or showy; stamens 5, unequal, 4 being didynamous, the fifth shortest, with a hypogynous fleshy disc. **FRUIT** an ovoid capsule, with 2 undivided valves. **SEEDS** minute, spherical or angled. About 40 species, largely South American, some of horticultural value.

Petunia parviflora Juss. (small-flowered) Prostrate, diffusely branched annual, glandular-pubescent. **STEMS** 10–40 cm long. **LEAVES** oblong-linear to oblong-spatulate, 0.4–1.2 cm long, rather fleshy. **FLOWER** calyx subsessile, 3–4 mm long, purplish with a whitish tube, the short lobes somewhat unequal. **FRUIT** a capsule 2–3 mm long. **SEEDS** about 0.6 mm long, pale brown, favose-reticulate. Streamsides and lake margins, often among cottonwood, *Baccharis*, and saltcedar stands. ARIZ: Apa; UTAH. 1220–1525 m (4000–5000'). Flowering: Apr–Sep. Southern California to Arizona, Texas, and Florida.

Physalis L. Ground-cherry, Husk Tomato

(bladder, referring to the inflated calyx) Annual to somewhat suffrutescent perennial herbs, subglabrous to pubescent with simple to dendritic or stellate hairs. **LEAVES** simple, alternate or somewhat unequally geminate, petiolate to subsessile, entire to sinuate-pinnatifid. **INFL** regular, usually solitary or sometimes in 2s or 3s, on mostly drooping pedicels. **FLOWER** calyx campanulate to cup-shaped, shallowly 5-lobed, shorter that the corolla at anthesis but becoming greatly inflated, dry, and membranous and completely enclosing the fruit; corolla usually yellowish, but sometimes white or bluish, often darker spotted at the base of the limb, 5-lobed; stamens 5, the filaments terete to flattened and broadly clavate in outline; anthers yellow or sometimes blue, dehiscing by full-length slits. **FRUIT** a fleshy, many-seeded berry. **SEEDS** flattened, the embryo curved. About 80 species.

1. Corolla blue to purple (rarely white), with a white, woolly star at the center; herbage scurfy with crystalline vesicles ..... ***P. lobata***
1' Corolla yellow, yellowish green, or white, with or without darker spots; plant surfaces generally not scurfy without crystalline vesicles ..... (2)
2. Fruiting calyx with 5 sharp folds; corolla 6–7 mm long; anthers blue ..... ***P. subulata***
2' Fruiting calyx not sharply folded; corolla more than 7 mm long; anthers yellow ..... (3)
3. Pubescence of forked to stellate or dendritic hairs ..... ***P. hederifolia***
3' Pubescence of simple hairs only ..... (4)
4. Plants annual, never rhizomatous ..... ***P. philadelphica***
4' Plants perennial, often rhizomatous ..... (5)
5. Stems freely branched and mostly strongly zigzag, rather brittle; restricted in our area to desert scrub communities; simple hairs throughout ..... ***P. crassifolia***
5' Stems not zigzag-branched, not brittle; not found in desert scrub communities; pubescence of the leaves minute or none, almost wholly restricted to the main veins ..... ***P. longifolia***

Physalis crassifolia Benth. (thick-leaved) Perennial or subshrub less than 80 cm tall; hairs simple, dense, short, generally glandular. **STEMS** mostly zigzag, rigid. **LEAVES** 1–3 cm long, generally ovate, fleshy, entire or more or less wavy; petiole more or less equal to the blade. **INFL** with pedicels 15–30 mm long in fruit, smaller in flower. **FLOWER** calyx 20–25 mm long, weakly angled; corolla 15–20 mm in diameter, widely bell-shaped, yellow; anthers 2–3 mm long, yellow. [*Physalis genucaulis* A. Nelson]. Open desert and rocky ravines and slopes in desert scrub communities. UTAH. 1125–1220 m (3700–4000′). Flowering: Mar–May. California, southern Nevada, northwest Arizona, and southern Utah south to Mexico.

Physalis hederifolia A. Gray (ivy-leaved) Ivy-leaved ground-cherry. Herbaceous perennial to subshrub, 10–80 cm tall; from fleshy rhizomes; hairs sometimes branched or glandular, sometimes found only on the calyx. **LEAVES** ovate, entire to coarsely toothed, 2–4 cm long, generally appearing green-gray, base tapered or subcordate. **INFL** pedicels 3–5 (10) mm in fruit. **FLOWER** calyx 7–10 mm long at anthesis, up to 30 mm in fruit; lobes triangular to lanceolate, with 10 green veins; corolla 10–15 mm long, widely bell-shaped, yellow, often with 5 purple-brown spots inside the base. $2n = 24$.

1. Hairs short, not multicellular, forked to dendritic, nonglandular ..... **var. *fendleri***
1′ Hairs partially or wholly long and multicellular, sometimes branched and sometimes glandular .... **var. *hederifolia***

var *fendleri* (A. Gray) Cronquist (for Augustus Fendler, German-American botanical collector) With hairs generally branched, generally nonglandular. [*Physalis fendleri* A. Gray; *P. fendleri* var. *cordifolia* A. Gray; *P. hederifolia* var. *cordifolia* (A. Gray) Waterf.]. Sagebrush, piñon-juniper, ponderosa pine, and Gambel's oak communities. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, San, SJn; UTAH. 1370–2285 m (4500–7500′). Flowering: May–Oct. California, southern Nevada, southern Utah, Arizona, and New Mexico, to Oklahoma and Texas, and south to Mexico.

var. hederifolia With hairs sometimes branched or glandular. Sagebrush, piñon-juniper, Gambel's oak, and mountain brush communities. ARIZ: Apa; COLO: Mon; NMEX: McK, SJn. 1600–2000 m (5250–6560′). Flowering: May–Oct. Southwest Utah, eastern Arizona, New Mexico, and south to Mexico.

Physalis lobata Torr. (lobed) Purple ground-cherry. Perennial herb, rhizomatous, often forming patches. **STEMS** spreading or prostrate, 10–50 cm long, usually diffusely branched, sparsely hairy with rounded, white, unicellular, pustulate or papillate hairs. **LEAVES** lanceolate to ovate, 1–7 cm long, entire or lobed, gradually tapering into a petiole that may be shorter or longer than the blade. **INFL** with flowers commonly in pairs in the leaf axils, sometimes solitary or in small clusters, with pedicels 3–4.5 mm, not generally longer in fruit. **FLOWER** calyx 3–6 mm long at anthesis, in fruit 15–20 mm, the lobes about 1/2 as long as the tube; corolla 15–20 mm in diameter, blue to violet or purple with a white, woolly star at the center; in fruit about 2 cm long and about as wide, sharply 5-angled, sunken at base. **FRUIT** greenish. Uncommon to rare, found mostly in desert grassland and piñon-juniper communities. NMEX: SJn; UTAH. 1525–1830 m (5000–6000′). Flowering: May–Oct. Kansas to Texas, Colorado, Nevada, Arizona, and northern Mexico.

Physalis longifolia Nutt. (long-leaved) Longleaf ground-cherry. Perennial herb with rather thick rhizomes, 30–60 (–100) cm tall, glabrous to somewhat pubescent with short, opaque, mostly appressed, obscurely stellate hairs on the upper part of the stem and on the pedicels and veins of the lower side of the leaves, and especially along the 10 principal nerves of the young calyx, often glabrate at maturity. **LEAVES** firm-textured, lanceolate or elliptic-lanceolate, 3–9 cm long, or narrowly rhombic and generally tapering to the petiole, entire or coarsely and irregularly blunt-toothed, the blade 4–10 cm long. **INFL** mostly solitary, with pedicels 1–4 cm long. **FLOWER** calyx campanulate, 7–10 mm long at anthesis, 25–35 (40) mm long in fruit, the lobes triangular or ovate, 3–4 mm long at anthesis, tube minutely strigose, mostly in 10 narrow longitudinal strips, with minute, appressed, simple or obscurely septate hairs, rarely as much as 0.5 mm long; corolla yellow, blotched with purple or reddish purple at the base of the limb, 11–20 mm long, 10–15 mm wide; anthers yellowish or bluish, 3–4 mm long. **SEEDS** about 2 mm long, minutely pitted. [*P. virginiana* Mill. var. *sonorae* (Torr.) Waterf.; *P. virginiana* var. *subglabrata* (Mack. & Bush) Waterf.]. A weed in fields and waste places; sagebrush, piñon-juniper woodland, and mountain brush communities. ARIZ: Apa; COLO: Mon; NMEX: McK, RAr, San, SJn; UTAH. 1370–2285 m (4500–7500′). Flowering: Apr–Aug. The Colorado Plateau east to the Atlantic. Four Corners material belongs to **var. *longifolia***.

Physalis philadelphica Lam. (of Philadelphia) Annual, much-branched, erect or spreading, 30–90 cm tall, glabrous, or the younger parts puberulent. **LEAVES** with blades ovate, cuneate, or cordate at base, entire to sinuate-dentate, 1.5–6 cm long, on equally long petioles. **INFL** pedicels 4–8 mm long. **FLOWER** calyx in flower 3.5–4.5 mm long, the deltoid lobes shorter than the tube, in fruit calyx ovoid, 1.5–2 cm long; corolla yellow with a dark center, 8–15 mm broad. **FRUIT** purple at maturity. $2n = 24$. [*P. ixocarpa* Brot. ex Hornem. var. *philadelphica*]. An orchard weed; escapes from

gardens, and mostly found in disturbed sites. NMEX: McK. 1220–1980 m (4000–6500'). Flowering Jun–Oct. Northern California to the Atlantic coast and Mexico. This species is sometimes cultivated for the fruits.

Physalis subulata Rydb. (awl-shaped) Chihuahuan ground-cherry Annual, 10–60 cm tall, foliage with usually dense more or less yellowish or brownish, capitate-glandular hairs. **STEMS** usually branched. **LEAVES** with blades 3–6 cm long, ovate to oblong-ovate or lanceolate-ovate, margins toothed, or sometimes sinuate-dentate; petioles 1/2 to 3/4 as long as the blades. **FLOWER** calyx in flower 3–3.5 mm long on peduncles usually 1.5–3 mm, in fruit 2–3 cm long; with 5 sharp folds, the teeth acuminate and more or less ovate in outline; peduncles mostly 4–7 mm long; corolla 6–7 mm long, bluish spotted; anthers (0.3) 1–1.5 (2) mm long, bluish; filaments filiform. [*Physalis fendleri* Rydb. var. *neomexicana* (Rydb.) Waterf.; *Physalis neomexicana* Rydb.]. Often in cultivated fields, piñon-juniper woodland, and ponderosa pine communities. NMEX: McK. 1830–2135 m (6000–7000'). Flowering Aug–Sep. New Mexico and adjacent Arizona and Colorado. Our material belongs to **var. *neomexicana*** (Rydb.) Waterf. ex Kartesz & Gandhi.

Solanum L. Nightshade

(classical Latin name used by Pliny) Annual to shrub or vine, glabrous to pubescent or tomentose, often glandular, sometimes prickly. **LEAVES** alternate to subopposite, often unequal, entire to deeply pinnately lobed. **INFL** commonly umbels or cymes, often 1-sided. **FLOWER** calyx 5-cleft or -toothed, more or less bell-shaped; corolla more or less rotate, 5-angled or -lobed, plaited in bud, white to purple, yellow; stamens 5, inserted on the corolla tube; filaments short, with anthers free, larger than the filaments, oblong or tapered, opening by 2 pores of short slits near the tip; ovaries 2-chambered, style 1, stigma small, capitate or bilobed. **FRUIT** a spheric berry or dry capsule. **SEEDS** many, compressed, generally reniform. More than 1500 species worldwide, especially in the tropics. Many species cultivated for food, including the potato (*S. tuberosum*) and the tomato (*S. lycopersicum*). Some species are grown as ornamentals and many are toxic.

1. Stems and leaves with prickles ..... (2)
1' Stems and leaves without prickles ..... (4)

2. Anthers all alike; leaves linear ..... ***S. elaeagnifolium***
2' Anthers dissimilar; leaves once- or twice-pinnatifid ..... (3)

3. Flowers yellow ..... ***S. rostratum***
3' Flowers violet ..... ***S. heterodoxum***

4. Leaves with blades deeply lobed or pinnatifid ..... (5)
4' Leaves with blades entire to shallowly lobed ..... (7)

5. Leaf blades deeply pinnatifid, with acute, triangular lobes ..... ***S. triflorum***
5' Leaf blades less deeply pinnatifid, with broad, rounded lobes ..... (6)

6. Flowers purple; a somewhat woody vine ..... ***S. dulcamara***
6' Flowers white; low herb with small round tubers ..... ***S. jamesii***

7. Corolla shallowly lobed, lobes shorter than the tube ..... ***S. xanti***
7' Corolla deeply lobed, lobes generally longer than the tube ..... (8)

8. Leaves thick; plants hirsute or glandular-villous; calyx enlarged at maturity and enclosing the fruit base ..... ***S. physalifolium***
8' Leaves thin, translucent; plants glabrous or nearly so; calyx remaining small, not covering part of the fruit at maturity ..... ***S. americanum***

Solanum americanum Mill. (of America) Black nightshade. Annual herb or subshrub, more or less glabrous or with hairs short, curved and more or less appressed. **STEMS** 30–80 (100) cm tall, slender, usually divergently branched, glabrous or nearly so. **LEAVES** with blades ovate, ovate-deltoid to lanceolate, entire or sinuately dentate, not green translucent to transmitted light, 2–10 cm long. **INFL** an umbel or more or less racemelike with slender peduncles 1–3 cm long, the pedicels usually shorter, becoming reflexed in fruit. **FLOWER** calyx 1–2 mm long, with lobes spreading to reflexed in fruit; corolla 3–6 mm wide, deeply lobed, white, sometimes faintly tinged with purple, 4–6 mm in diameter; anthers yellow, 1.4–2.2 mm long, style 2.5–4 mm long. **FRUIT** a berry, 5–8 mm in diameter, greenish or black, shiny. **SEEDS** pale cream, many, reticulate-pitted, 1–1.5 mm in diameter. $x = 12$. [*S. nodiflorum* Jacq., *S. nigrum* L.]. A weed.

of cultivated ground; low valleys. ARIZ: Apa, Nav; COLO: Mon. 1525–1980 m (5000–6500′). Flowering: Jul–Oct. Canada to the eastern United States and south to Mexico.

Solanum dulcamara L. (bittersweet) Bittersweet, climbing nightshade. Perennial herb to subshrub. **STEMS** generally less than 1 m tall, climbing; more or less glabrous or with soft simple hairs, sometimes dendritic. **LEAVES** more or less cordate to deeply 1–2-lobed near the base, 5–12 cm long. **INFL** generally 8–30-flowered, in umbel-like clusters in the forked axils, with peduncles 1.5–4 mm long and pedicels 5–10 mm long. **FLOWER** calyx 3–4 mm long, with lobes broadly triangular and about 1 mm long; corolla 8–12 mm wide, deeply lobed, the lobes lanceolate, 6–8 mm long, spreading to reflexed, about 3 times as long as the tube, purple or violet, lobed base with 5 pairs of green spots; anthers about 5 mm long. **FRUIT** a berry, 8–12 mm in diameter, more or less ovoid, red. **SEEDS** 2–3 mm long. $2n = 24$. A nonnative weed often found along fencerows. COLO: LPl, Mon; NMEX: SJn. 1585–2135 m (5200–7000′). Flowering: May–Sep. Canada to the eastern United States; native of Eurasia.

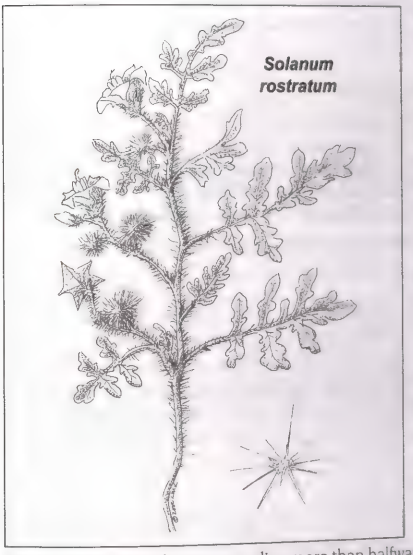
Solanum elaeagnifolium Cav. (marsh plant) Horse-nettle. Herbaceous perennial with tough, deep-seated rhizomes; stellate-silvery canescent throughout. **STEMS** up to 1 m tall; the stems, petioles, and midribs of the leaves usually sparsely to densely prickly with slender yellow spines 1–5 mm long. **LEAVES** with blades linear to oblong or lanceolate, 3–10 cm long, repand-dentate margin, or the smaller leaves entire, veins prominent below. **INFL** cymose. **FLOWER** calyx ovate to linear, about 1 cm long, calyces usually armed with straight yellow spines, little if at all accrescent in fruit, the lobes linear, shorter to slightly longer than the tube; corolla violet or blue (rarely white), 2–3 cm in diameter, with lobes ovate, but abruptly acute, longer than the tube; anthers 7–9 mm long, yellow, all alike. **FRUIT** a berry, globose, 9–14 mm in diameter, yellow or brown, smooth, glabrous. **SEEDS** flattened, about 3 mm in diameter, brown. $2n = 24$. A native weed found in disturbed sites, especially roadsides. Blackbrush, sagebrush, and piñon-juniper woodland communities. ARIZ: Apa, Nav; COLO: Mon; NMEX: McK, SJn; UTAH. 1525–2135 m (5000–7000′). Flowering: Apr–Aug. Washington, Idaho, south to California, Nevada, Arizona, Colorado, Utah, New Mexico, east to North Carolina, south to Mexico; South America.

Solanum heterodoxum Dunal (*hetero*, other, + *doxum*, glory) Melon-leaf nightshade. Herbaceous annual with pubescence of glandular-tipped hairs mixed with a few 5-rayed bristles, and copiously armed with yellow spines, especially on the petiole, stems, and calyces. **LEAVES** resemble those of the watermelon; blades pinnatifid with rounded lobes, segments ovate to obovate and obtuse. **STEMS** branched, 15–80 cm tall. **INFL** cymose. **FLOWER** calyx enlarging and closely investing the fruit, armed with long, straight, straw-colored, sharp spines; corolla about 35 mm in diameter; violet; anthers yellow, the lowest one larger than the others, spreading, and tinged with purple. **FRUIT** a berry closely invested by the accrescent, spiny calyx. Waste places and roadsides. NMEX: SJn. 1830 m (6000′). Flowering: Jul–Sep. Arizona, New Mexico, Colorado (El Paso County), New Mexico, and west Texas to Mexico. Our material belongs to **var.** ***novomexicanum*** Bartlett (of New Mexico).

Solanum jamesii Torr. (for Edwin James, surgeon-naturalist) Wild-potato. Perennial herb with rhizomes bearing tubers about 10–15 mm in diameter. **STEMS** 10–45 cm long, erect or spreading, glabrous or nearly so to sparsely pilose. **LEAVES** pinnate with 5–9 leaflets, the leaflets lanceolate-oblong, entire or nearly so, glabrous or nearly so, 5–60 mm long, the terminal leaflet the largest, lateral leaflets smaller. **INFL** in a few- to several-flowered cyme. **FLOWER** calyx enlarging somewhat but not investing the fruit; corolla white, 12–18 mm in diameter; anthers yellow, about 5–6 mm long. $2n = 24$. Piñon-juniper woodlands and mountain brush communities. ARIZ: Apa; COLO: Arc, LPl, Mon; NMEX: McK, San, SJn; UTAH. 1675–2285 m (5500–7500′). Flowering: Jul–Sep. Southern Utah, Arizona to northern Mexico, east to Colorado and New Mexico. The tubers are edible.

Solanum physalifolium Rusby (leaf like a *Physalis*) Hairy nightshade. Annual with herbage strongly viscid-villous with somewhat flattened hairs throughout. **STEMS** prostrate to decumbent or ascendingly branched, 10–50 (–100) cm tall. **LEAVES** with blades narrowly to broadly deltoid to oblong-lanceolate, (2) 3–6 (8) cm long, subentire to deeply sinuate-dentate, obtuse or acute at the apex, gradually or abruptly narrowed at the base, the petioles mostly 10–15 mm long. **INFL** corymbose, sometimes branched, with flowers on stout peduncles, 5–15 mm long or more, the pedicels shorter and swollen immediately below the calyx. **FLOWER** calyx with lobes deltoid-lanceolate, 1–1.5 mm long, shorter than the tube, becoming enlarged in fruit, 4–6 (9) mm long, the connate portion expanded and cupping the lower 1/2 of the berry; corolla white to greenish white, 3–5 mm in diameter, the lobes spreading, narrowly deltoid-lanceolate, (2) 2.5–3 mm long, white-villous near the tip outside; anthers erect, about 2 mm long, yellow; style barely exceeding the stamens. **FRUIT** a berry, globose, 6–7 mm in diameter, greenish or yellowish at maturity, sometimes brownish or reddish, many-seeded. **SEEDS** yellowish, finely reticulate-pitted, about 2 mm long. $2n = 24$. [*S. sarrachoides* Sendtn.;

Bosleria nevadensis A. Nelson]. A weedy species found in fields, roadsides, and gardens. ARIZ: Apa; Nav; COLO: Mon; NMEX: McK. 1525–1980 m (5000–6500'). Flowering: May–Oct. A native of South America, it is now widespread from British Columbia south to California and Arizona.



Solanum rostratum Dunal (curved at the end) Buffalo-bur. Stout annual, densely stellate-pubescent throughout, armed with yellow spines 3–12 mm long. **STEMS** 20–80 cm tall, branched. **LEAVES** with blades oval to ovate, irregularly pinnately lobed or twice-pinnatifid, up to 5 cm wide, 12 cm long. **INFL** in few-flowered racemes with stout peduncles, 1–5 cm long. **FLOWER** calyx 5–7 mm long at anthesis, the lobes about as long as the tube; corolla yellow, 18–28 mm in diameter, anthers yellow, with 4 of them 5–6 mm long, and the fifth about twice as long, curved in the distal 1/3 and darker. **FRUIT** a berry, globose, 9–10 mm in diameter, smooth, glabrous, brown. **SEEDS** about 3 mm. $2n = 24$. A weed of disturbed sites. ARIZ: Apa; COLO: Arc, LPl, Mon; NMEX: McK, RAr, San, SIn; UTAH. 1525–2135 m (5000–7000'). Flowering: Jun–Sep. North Dakota to Wyoming, south to Mexico. Native east of the Rocky Mountains.

Solanum triflorum Nutt. (three-flowered) Cut-leaved nightshade. Annual, sparsely to copiously pubescent and often somewhat scurfy, with appressed hairs. **STEMS** prostrate to decumbent, 10–40 cm long, spreading up to 1 m broad. **LEAVES** numerous, with blades ovate, 2–4 (5) cm long, 1 cm broad, oblong-ovate to elliptic, pinnatifid, deeply lobed, the lobes lanceolate to linear, extending more than halfway to the midrib, the sinuses between the lobes rounded, on slender petioles, 10–25 cm long. **INFL** a cyme with 2–3 umbellate flowers, peduncles short, 1–1.5 (2) cm, and with stout pedicels, often about the same length as the peduncles. **FLOWERS** 1–3 together, 5–15 mm long, calyx 2–3 mm long at anthesis, in fruit enlarging up to 6 mm; strongly accrescent, not investing the fruit but persisting at its base, not at all spiny; corolla white, 7–9 mm in diameter; anthers all alike, about 3 mm long, the filaments glabrous. **FRUIT** a berry, globose, 6–12 mm in diameter, greenish, smooth. **SEEDS** about 2 mm long, yellowish to pale brown, finely reticulate-pitted. $2n = 24$. Blackbrush, sagebrush, piñon-juniper woodland, and mountain brush communities. ARIZ: Apa; Coc; Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SIn; UTAH. 1525–2285 m (5000–7500'). Flowering: May–Sep. Considered to be native to the Great Plains of North America and now widespread as a weed in southwestern Canada and throughout the western states, where it may or may not be native.

Solanum xanti A. Gray (for John Xantus de Vesey, a Hungarian lawyer) Chaparral nightshade. Sulfrutescent perennial, usually with many slender stems. **STEMS** spreading, 20–100 cm long, the herbage strongly to sparsely short-villous throughout with a mixture of simple, 1-celled hairs, dendritic (forked or branched), and glandular hairs. **LEAVES** with blades ovate to lanceolate-ovate, 2–4 cm long or more, entire to subentire, rounded or acute to bastately lobed at the base. **INFL** mostly in 4–10 subumbellate cymes; peduncles 5–12 mm long, pedicels slender, basally cupulate-bracteolate, 5–15 (20) mm long. **FLOWER** calyx 3.5–5 (6) mm long at anthesis, the lobes deltoid, usually shorter than the tube; corolla deep blue to violet or dark lavender, 15–25 mm in diameter, lobed about 1/3 the length of the lobes, spreading, more or less abruptly acute; anthers about 4 mm long, yellow, filaments about 2 mm long. **FRUIT** a berry, globose, 6–12 mm in diameter, greenish, smooth. **SEEDS** about 2 mm long, yellowish to pale brown. $2n = 24$. Desert scrub and piñon-juniper woodland communities. ARIZ: Apa; Nav. 1525–1830 m (5000–6000'). Flowering: May–Jul. Oregon, California, eastward to eastern Nevada and south to Baja California.

TAMARICACEAE Link TAMARISK FAMILY

Kelly W. Allred

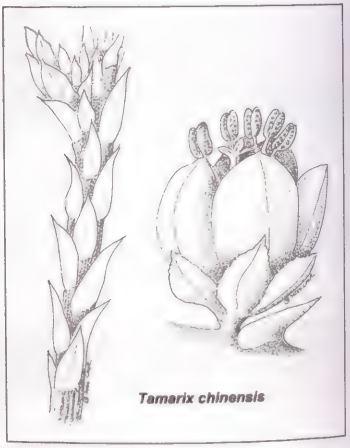
Much-branched shrubs or small trees of desert and saline habitats. **LEAVES** simple, stipules absent, blades entire, alternate, scalelike, often completely covering the twigs, with salt-excreting glands. **INFL** solitary or commonly in dense scaly spikes, racemes, or panicles. **FLOWERS** actinomorphic, small, 4- or 5-merous, perfect, with a hypogynous

nectar disc; sepals 4–5, distinct; petals 4–5, distinct, alternating with the sepals; stamens 4–10 or many, distinct or connate at the base, the anthers opening by longitudinal slits; pistil of 2–5 united carpels; locule 1; ovules few to many and borne on parietal or basal placentae; ovary superior; style usually free; stigmas 2–5. **FRUIT** a loculicidal capsule. **SEEDS** with an apical tuft of hair; embryo straight, typically without endosperm. The family consists of four genera and 78 species native to Eurasia. The largest genus is *Tamarix*, with 54 species, several of which have been introduced widely in western North America.

Tamarix L. Saltcedar, Tamarisk

(ancient Latin name, possibly named for the Tamaris River in Spain) Deciduous or evergreen (ours) shrubs. **LEAVES** as in the family. **INFL** a bracteate raceme or spike, these sometimes aggregated into a terminal panicle. **FLOWERS** small, numerous; sepals 4–5, persistent; petals white to pink or reddish, sometimes persistent; stamens 4–5 (ours) or numerous; stigmas 3–4. **FRUIT** a capsule separating into 3–4 valves, many-seeded. **SEEDS** with a tuft of hair at the terminal end. $x = 12$. About 54 species native to Eurasia and Africa. The twigs of *T. mannifera* produce a sweet, gummy, white substance considered by some to be the source of the biblical manna (Allred 2002; Baum 1967, 1978; Di Tomaso 1998).

Tamarix chinensis Lour. (of China) Saltcedar. Multistemmed shrubs or small trees, to 6 m tall, forming dense thickets; bark of larger trunks reddish brown to dark brown or blackish. **LEAVES** scalelike, 1.5–3.5 mm long, lanceolate-triangular, deciduous with the branchlets. **INFL** of numerous racemes, each 2–7 cm long, 3–5 mm wide in flower (wider in fruit), often aggregated into terminal panicles. **FLOWERS** 5-merous, pedicel about as long as the sepals; sepals 0.5–1.3 mm long, entire or minutely toothed; petals 1–2.3 mm long, persistent in fruit; stamens 5, the filaments emerging from between the emarginate or rounded lobes of the nectary disc, which may be variable in shape, symmetry, and filament insertion. **FRUIT** a capsule, 3–4 mm long. $2n = 24$. [*T. pentandra* Pall., nom. illeg.; *T. ramosissima* Ledeb.]. Along watercourses, riverbeds, washes, and roadsides in desert and foothill communities. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. Flowering: Apr–Sep (later farther south). Native to Eurasia, now introduced throughout western North America, southern Canada to northern Mexico. This is the common saltcedar that has overrun vast tracts of wetlands, riparian areas, and disturbed ground throughout the Southwest. All recent studies in the genus support the sinking of *T. ramosissima* into synonymy; populations in North America have hybridized extensively and cannot be differentiated, even though they remain distinct in their native ranges.



Tamarix chinensis

TYPHACEAE Juss. CATTAIL FAMILY

(including SPARGANIACEAE Hanin BUR-REED FAMILY)

C. Barre Hellquist

Perennial, monoecious, rhizomatous, caulescent, emergent or floating herbs. **LEAVES** basally disposed, cauline mostly 2-ranked; sheaths open, tapering into blade, auriculate or nonauriculate; blades flat or keeled, some twisted, apex acute, obtuse, or retuse, aerenchyma present. **INFL** 1, terminal, erect, emergent or floating, below or exceeding leaves, spikelike or globose; staminate flowers above pistillate flowers, deciduous, with a persistent aril; pistillate heads or spikes often subtended by a persistent or deciduous bract, axillary or supra-axillary. **FLOWERS** unisexual, staminate and pistillate on the same plant, wind-pollinated; staminate flowers stipitate or sessile, stamens 1–several; pistillate flowers hypogynous, sessile to stipitate, pistil 1, ovaries 1–2 (–3)-locular. **FRUIT** an achenelike drupe, or follicle. **SEEDS** with starchy or mealy embryo, cylindrical or straight (Hotchkiss and Dozier 1949; Smith 1987; Stuckey and Salamon 1987). Two genera, 22–27 species. *Typha* has been used by Native Americans of the Four Corners area for food and beverages, for smoking by the Hopi, Navajo, and Southern Paiute, for medicine by the Navajo, and for textiles by the Navajo and Ute.

1. Fruits in globose, burlike heads, green-brown; stems keeled or flattened, floating or erect ..... ***Sparganium***
1′ Fruits in cylindric, spikelike heads, brown-cinnamon; stems flattened, twisted, erect ..... ***Typha***

Sparganium L. Bur-reed

(Greek, probably a name used by Dioscorides, derived from *sparganon*, swaddling band, for strap-shaped leaves) Herbaceous, monoecious; freshwater, emergent or floating; rhizomatous **LEAVES** flat, plano-convex, or keeled, spongy. **INFL** single, terminal, erect or floating; heads globose, sessile or peduncled; pistillate heads subtended by axillary or supra-axillary bracts. **FLOWERS**: staminate sessile, whitish, stamens 2–8, exceeding tepals; pistillate flowers sessile to stipitate, pistil 1, exceeding tepals; stigmas 1–2, white to greenish, linear, ovate, or subcapitate. **FRUIT** an achenelike drupe, often constricted at or near center, sessile or stipitate, tepals persistent, attached at base in most species. **SEEDS** 1–2 (–3), slender-ovoid. $x = 15$ (Cook and Nicholls 1986, 1987; Kaul 2002). Fourteen species. There appears to be no record of southwestern tribes utilizing bur-reeds. Unspecified species have been used as human food and cattle feed.

1. Staminate heads 1; pistillate heads 8–12 mm in diameter ..... ***S. natans***
1′ Staminate heads 2 or more; pistillate heads 10–35 mm in diameter ..... (2)

2. Stems submersed and floating; leaves flat, not keeled; fruit beak 1.5–2.2 mm long ..... ***S. angustifolium***
2′ Stems erect; leaves keeled; fruit beak 2–4.5 mm long ..... ***S. emersum***

Sparganium angustifolium Michx. (narrow-leaved) **STEMS** slender, floating, up to 2 m long. **LEAVES** flat or plano-convex, 2–5 (–10) mm wide, middle and upper leaves dilated with subinflated base. **INFL** unbranched, with 1 or more of the 1–3 pistillate heads supra-axillary, 1–3 cm in diameter; staminate heads 1–4 (–6). **FLOWERS** with tepals, stigma 1, lance-ovate. **FRUIT** usually reddish at base, 3–7 mm long, 1.2–1.7 mm thick, constricted at center, beak 1.5–2.2 mm long. **SEEDS** 1. $2n = 30$. [*S. angustifolium* var. *multipedunculatum* (Morong) Brayshaw; *S. emersum* Rehmann var. *multipedunculatum* (Morong) Reveal; *S. multipedunculatum* (Morong) Rydb.; *S. simplex* Huds. var. *multipedunculatum* Morong] Acid waters of ditches, lakes, ponds, and rivers. COLO: Arc, LPl, Min, Mon, SIn; NMEX: McK, RAr, SIn; UTAH: 2640 to 2750 m (8675–9075′). Flowering: Jun–Jul. Fruit: Jul–Aug. Alaska east to Quebec and Newfoundland, south to California, New Mexico, Minnesota, Connecticut, New Hampshire, and Maine.

Sparganium emersum Rehmann (emergent) **STEMS** robust to slender, erect, to 0.8 (–2) m, some floating. **LEAVES** flat or slightly keeled, slightly dilated at base, 2–12 mm wide. **INFL** usually simple; pistillate heads 1–6, supra-axillary, sessile, 16–35 mm in diameter, the lowest borne 16–65 cm above the base; staminate heads 3–7 (–10), contiguous or not. **FLOWERS** with tepals linear-lanceolate, stigma 1. **FRUIT** green to reddish brown, lustrous, 3–4 mm long, 1.5–2 mm thick, slightly constricted below center, beak straight or curved, 2–4.5 mm long. **SEEDS** 1. $2n = 30$. [*S. angustifolium* Michx. subsp. *emersum* (Rehmann) Brayshaw; *S. chlorocarpum* Rydb.; *S. chlorocarpum* var. *acaule* (Beeby ex Macoun) Fernald; *S. emersum* subsp. *acaule* (Beeby ex Macoun) C. D. K. Cook & M. S. Nicholls] Neutral to alkaline waters of ditches, ponds, lakes, and river shores. COLO: Hin, LPl, SJn; NMEX: McK, RAr, SIn. 2470–2850 m (8100–9350′). Flowering: Jun–Jul. Fruit: Jul–Aug. Alaska east to Quebec and Newfoundland, south to California, New Mexico, Nebraska, Ohio, and North Carolina.

Sparganium natans L. (swimming) Northern bur-reed. **STEMS** slender, floating or suberect when stranded, to 60 cm. **LEAVES** flat, unkeeled, 1.5–8 mm wide. **INFL** unranked, with 1–3 (–4) axillary pistillate heads, 8–12 mm in diameter; staminate head 1, terminal. **FLOWERS** with tepals, stigma 1, lance-ovate. **FRUIT** dark green or brown, subsessile, body ellipsoid to obovoid, slightly constricted at center, 3–3.5 mm long, beak 0.5–1.5 mm long. **SEEDS** 1. $2n = 30$. [*S. minimum* (L.) Fr.]. Acid, neutral, and slightly alkaline waters of ponds, lakes, and ditches. COLO: Arc, Hin, LPl, SIn; NMEX: SJn. 2630–2675 m (8675–9080′). Flowering: Jun–Jul. Fruit: Jul–Aug. Alaska east to Quebec and Newfoundland, south to California, Colorado, New Mexico, Illinois, Pennsylvania, and Rhode Island.

Typha L. Cattail

(Greek, possibly from *typhein*, to smoke or emit smoke, possibly used in maintaining smoky fires, or from the smoky color of the mature spikes) Herbs of fresh, brackish, or slightly saline water, emergent from horizontal rhizomes. **LEAVES** linear, persistent, twisted, slightly oblanceolate, plano-convex or concavo-convex. **INFL** a spike with staminate scales shorter than or exceeding flowers; pistillate spikes brown, orange-brown to cinnamon-colored at spike surface. **FLOWERS** with pistillate hairs exceeded by the stigmas. $x = 15$. About 8–13 species worldwide.

1. Staminate heads usually contiguous with pistillate heads; pistillate heads 24–36 mm thick, dark brown ..... ***T. latifolia***
1′ Staminate heads separated from pistillate heads; pistillate heads 6–20 mm thick, medium brown to cinnamon brown, 13–25 mm thick ..... (2)

2. Pistillate spikes medium brown; leaf sheath with terminal membranous auricles; flowering stems 2–3 mm thick at inflorescence ..... ***T. angustifolia***
2' Pistillate spikes cinnamon to orange-brown; leaves tapered to blades, occasionally with membranous auricles; flowering stems 3–4 mm thick at inflorescence ..... ***T. domingensis***

Typha angustifolia L. (narrow-leaved) Narrow-leaved cattail. **STEMS** 0.75–1.5 (–3) m tall, flowering shoots 2–3 mm thick near the spike. **LEAVES** 3–8 mm broad, slightly convex on back, leaf sheath with terminal membranous auricles disintegrating late in season. **INFL** with staminate spike 3–15 cm long, pistillate spike 6–20 cm long, 5–6 mm thick, medium brown, with the pistillate spike separated by 1–8 (–12) cm, usually above the height of the leaves. **FLOWERS**: staminate, 4–6 mm, anthers 1.5–2 mm, pollen single or in clumps; pistillate flowers 2 mm, pistillate hairs green when young, straw-colored with orange-brown spots when dried. $2n = 30$. Fresh, brackish, or slightly saline wetlands and shores of ponds, lakes, and rivers. ARIZ: Apa; COLO: Arc, Mon, SJn; NMEX: SJn; UTAH. 1530–2015 m (5050–6650'). Flowering: Jun–Jul. Fruit: Jul–Aug. British Columbia, east to Quebec and Newfoundland, south to California, New Mexico, Louisiana, and South Carolina; Eurasia. Stuckey and Salamon (1987) believed that *T. angustifolia* was introduced from Europe into the coastal waters of the eastern United States. In more recent years it expanded its range in roadside ditches and disturbed habitats. This species has been documented hybridizing with *T. latifolia* as *T.* ×*glauca* Godr. and with *T. domingensis.* This species has been used as cordage, fiber, and fine matting by prehistoric native tribes. Modern tribes have used it as a kidney medicine, the mature heads chewed with tallow as gum, and the pollen used for baking. The tender young shoots are eaten raw. The fiber has been used in weaving baskets and for baby diapers, and the pollen as ceremonial skin decorations.

Typha domingensis Pers. (of Santo Domingo) Southern cattail. **STEMS** 1.5–4 m tall, flowering shoots 3–4 cm thick near the spike. **LEAVES** 6–18 mm broad, flat, leaf sheath with persistent, membranous auricles. **INFL** with staminate spike 6–35 cm long, 5–6 mm thick, cinnamon-brown; pistillate spike separated by (0–) 1–8 cm, usually above the height of the leaves. **FLOWERS**: staminate 5 mm, anthers 2–2.5 mm, pollen grains single; pistillate flowers 2 mm, pistil hair tips straw-colored to orange-brown in mass. $2n = 30$. Fresh or brackish wetlands, and shores of lakes, ponds, and rivers. ARIZ: Apa, Nav; COLO: Mon; NMEX: RAr, SJn; UTAH. 1350–1975 m (4775–6475'). Flowering: Jun–Aug. California, Wyoming, Nebraska, Illinois, and Delaware, south to Arizona, Texas, Louisiana, and Florida; Mexico; Central America, South America, West Indies; Eurasia, Africa; Pacific Islands; Australia. Flowering: Jul–Aug. Fruit: Jul–Oct. This is a highly aggressive species found throughout the United States and worldwide north and south of 40° latitude. Hybrids with *T. angustifolia* and *T. latifolia* occur throughout its range. Fruiting heads eaten like corn by various tribes nationwide. Fiber was widely used in roofing, mats, and bedding.

Typha latifolia L. (broad-leaved) Common cattail. **STEMS** stout, 1–3 m tall; flowering shoots 3–7 mm thick near the spike. **LEAVES** 6–23 mm broad, flat; leaf sheath with terminal membranous auricles. **INFL** with staminate spike 7–13 cm long, pistillate spike 2.5–20 cm long, 12–35 mm thick, dark brown, 24–36 mm thick in fruit, with the pistillate spike usually contiguous, rarely with 4 (–8) cm separation, usually at the same height as the leaves. **FLOWERS**: staminate 5–12 mm, anthers 1–3 mm, pollen in tetrads; pistillate flowers 2–3 mm, pistil hairs straw-colored. $2n = 30$. Fresh to slightly brackish wetlands, and shores of ponds, lakes, and rivers. ARIZ: Apa, Nav; COLO: Arc, Dol, Hin, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1950–2150 m (5400–7050'). Alaska east to Quebec and Newfoundland, south throughout the United States; worldwide. This is one of the most common aquatic plants worldwide. Flowering: Jun–Aug. Fruit: Jul–Oct. It has been introduced into parts of Australia. This species has been documented hybridizing with *T. angustifolia* L. as *T.* ×*glauca* Godr. and also with *T. domingensis*. *Typha latifolia* has been used as food and beverage by most of the Pueblos and for construction by the southern Tiwa. The Mescalero Apache have used the pollen as medicine. The Navajo have used the plant as a ceremonial medicine and emetic, and the leaves for baskets and water jugs. The Apache cooked the rootstalks with meat in the early growing season and used the fibers for matting and roofing material.

ULMACEAE Mirb. ELM FAMILY

Jane Mygatt

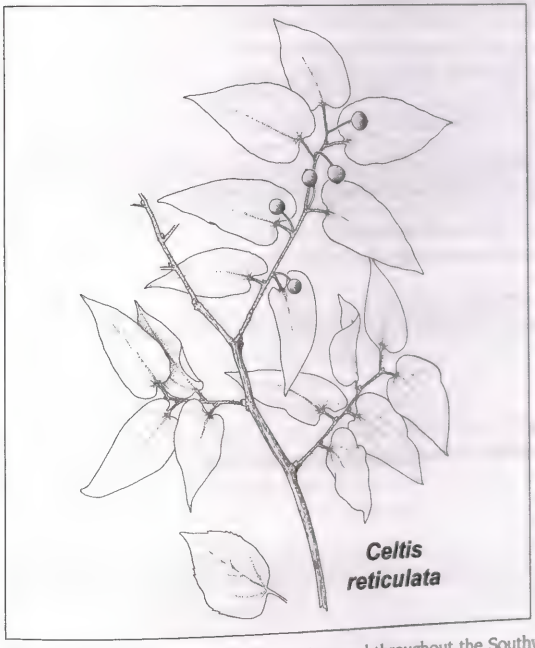
Trees or shrubs, deciduous. Bark grayish to brown, warty to deeply furrowed; sap watery. **LEAVES** alternate, simple; stipules deciduous, petiole present; blade often oblique at the base, margin entire or serrate; venation pinnate to palmate-pinnate. **INFL** few-flowered and axillary, or in cymose fascicles. **FLOWERS** hypogynous, bisexual or unisexual, small and inconspicuous, actinomorphic or nearly so; sepals persistent, usually 5; petals absent; stamens usually as

many as calyx lobes and opposite them; pistil 1, of 2 carpels; styles 2, distinct. **FRUIT** a drupe or samara. About 18 genera, about 150 species in tropical and north-temperate regions. Plants of this family are wind-pollinated.

1. Leaf blade palmately veined at base, pinnately veined over remainder of blade; flowers usually unisexual; fruit a drupe ..... ***Celtis***
1′ Leaf blade pinnately veined; flowers bisexual; fruit a samara ..... ***Ulmus***

Celtis L. Hackberry, Sugarberry

Trees or shrubs to 8 m; crown spreading. Bark usually gray, with corky ridges. **LEAVES** pinnately veined but somewhat 3-veined from the base, upper surface usually conspicuously roughened to the touch; leaf blade deltate to ovate, thick, base cordate or oblique; margin entire or serrate-dentate. **FLOWERS** usually unisexual, staminate and pistillate on the same plants, along with a few bisexual flowers; pedicellate on branches of current year appearing in midspring or late spring; staminate flowers with filaments incurved in bud, exserted after anthesis, gynoecium minute, rudimentary; pistillate flowers with calyx 4 (–5)-lobed; ovary sessile, ovoid; styles short, divided into 2 divergent, elongate, reflexed lobes. **FRUIT** a globose drupe; ripening in autumn, persisting after leaves fall. $x = 10$. About 60 species of tropical and temperate regions, worldwide.



Celtis reticulata Torr. (netted) Netleaf hackberry, palo blanco. Branches villous when young. **LEAVES** with petiole 3–8 mm long; leaf blade ovate, 3–6.5 × 2–4.5 cm, thick, rigid, base cordate or inequilateral, margins entire or serrate above the middle, apex obtuse, acute, or acuminate; surfaces pubescent, abaxially yellow-green, adaxially gray-green, grooved, ± scabrous; prominently reticulate-veined on lower surface. **INFL** of 1–4 flowers in axils of young leaves. **FRUIT** a drupe, orange-reddish when ripe, orbicular, averaging 8–10 mm diameter, beaked; pedicel 10–14 mm. [*C. brevipes* S. Watson; *C. laevigata* Willd. var. *reticulata* (Torr.) L. D. Benson; *C. douglasii* Planch.; *C. occidentalis* L. var. *reticulata* (Torr.) Sarg.; *C. reticulata* Torr. var. *vestita* Sarg.] Along streams and rocky canyons; widespread throughout the Southwest. ARIZ: Apa, Nav; COLO: LPl, Mon; NMEX: RAr, SJn; UTAH. 1060–1830 m (3500–6000′). Flowering: Apr–May. Fruit: Jun. Navajos use *C. reticulata* medicinally, in the treatment of indigestion.

Ulmus L. Elm, Orme, Olmo

(Latin for elm) Trees to 30 m; crowns open, with slender unarmed branches; twigs pubescent. Bark gray to brown. **LEAVES** late-deciduous; stipules early-deciduous; leaf blade ovate to elliptic, base usually oblique, margins serrate; venation pinnate. **INFL** in fascicles, subtended by 2 bracts, on branches of previous season, appearing in spring before leaves. **FLOWERS** bisexual, pedicellate or sessile; calyx 3–9-lobed; stamens 3–9; styles persistent, deeply 2-lobed. **FRUIT** a samara, broadly winged. Twenty to 40 species of northern temperate regions, most in Eurasia. Siberian elm (*U. pumila*) sometimes has been mistakenly called Chinese elm. Chinese elm (*U. parvifolia*) is a cultivated tree which flowers in late summer–early fall. *Ulmus parvifolia* is not included in this treatment, as herbarium records do not indicate this species has naturalized in the region.

Ulmus pumila L. (dwarf) Siberian elm. Introduced small to medium-sized tree. Bark rough and furrowed. **LEAVES** with petiole 2–7 mm long; leaf blade ovate to narrowly elliptic, 2–6.5 × 2–3.5 cm, base ± oblique; margins serrate, with

many straight side veins, apex acute. **INFL** in clusters; 3 mm wide; greenish. **FLOWERS** with calyx shallowly lobed, lobes 4–5, glabrous; stamens 4–8, anthers brownish red; stigmas green, lobes exserted. **FRUIT** a samara, 10–15 mm diameter, flat, orbiculate, with notched wing 1/3 to 1/2 length; several clustered. $2n = 28$. [*U. campestris* L. var. *pumila* Maxim.; *U. manshurica* Nakai; *U. turkestanica* Req.]. Disturbed areas and roadsides, canyons, forested and riparian areas. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1600–2500 m (5300–8200'). Flowering: Jan–Mar. Fruit: Apr–May. Siberian elm has been widely introduced in the United States and commonly escapes cultivation. It is on state noxious weed lists for 42 states.

URTICACEAE Juss. NETTLE FAMILY

Jane Mygatt

Herbs, ours annuals or rhizomatous perennials. Stems and leaves usually pubescent, often with specialized stinging hairs, and with calcium carbonate cystoliths commonly present, often independently of the hairs. **LEAVES** opposite or alternate, simple, petioles present; stipules present or absent; lamina margins entire or serrate to dentate. **INFL** usually an axillary cymose panicle or raceme. **FLOWERS** small, inconspicuous; plants monoecious, dioecious, or polygamous, bisexual or unisexual; anemophilous; petals absent; perfect flowers (when present) with 4 sepals; stamens 4; staminate flowers often pedicellate, white or green; sepals 4–5; stamens 4–5 (4 in ours), filaments inflexed in bud, reflexed when pollen is shed; pistillate flowers often sessile, green or reddish; sepals 2–4 (4 in ours), hypogynous; pistil 1, ovule 1; style present or stigma sessile. **FRUIT** an achene, surrounded by persistent perianth (Woodland 1982). Genera about 48, species about 700–800; widely distributed primarily in tropical and subtropical regions.

1. Stinging hairs absent; leaves alternate, margin entire; stipules absent ..... ***Parietaria***
1' Stinging hairs present; leaves opposite, margin dentate to serrate; stipules present ..... ***Urtica***

Parietaria L. Pellitory

(Latin *parietarius*, of walls, where the plant likes to grow) Herbs, annual (in our flora) or perennial, sparsely to densely pubescent; lacking stinging hairs. **LEAVES** alternate, simple, stipules absent, margins entire, lanceolate to round. **INFL** a few-flowered panicle or spike, subtended by an involucre of 1–3 bracts. **FLOWERS** perfect, staminate, or pistillate; lower flowers usually perfect and staminate, upper pistillate; sepals fused basally. **FRUIT** shiny, hard, ovate, and stipitate, enclosed by sepals. Twenty to 30 species worldwide.

Parietaria pensylvanica Muhl. ex Willd. (of Pennsylvania) Pennsylvania pellitory. **STEMS** 4–60 cm, decumbent to erect, simple or branched. **LEAVES** linear-lanceolate to ovate, 2–9 cm × 0.4–3 cm, base tapered to obtuse, apex acuminate to long-tapered, lowest lateral veins arising from midrib. **FLOWERS** subtended by involucral bracts 1.8–5 mm long and exceeding the sepals; sepals 1.5–2 mm long. **FRUIT** brownish, 0.9–1.3 mm long × 0.6–0.9 mm wide, apex obtuse. $2n = 14, 16$. [*P. obtusa* Rydb.; *P. occidentalis* Rydb.; *P. pensylvanica* var. *obtusa* (Rydb. ex Small) Shinners]. Moist banks along margins of rivers to ledges in canyons, and shady areas. ARIZ: Apa; UTAH. 1730–2200 m (5700–7200'). Flowering: Apr–Jul. British Columbia to Quebec, and most of the United States into Mexico. This native species is reported in the USDA Plants database as a noxious weed of Nebraska and the Great Plains.

Urtica L. Nettle

(Latin *uro*, to burn, referring to the stinging hairs) Monoecious or dioecious herbs (in our flora) to shrubs with stinging and nonstinging hairs. Stems simple or branched, erect to sprawling. **LEAVES** opposite, stipules present; lanceolate to broadly ovate, margins dentate to serrate; cystoliths round to elongate. **INFL** an axillary, cymose raceme or panicle. **FLOWERS**: staminate with 4 equal sepals; stamens 4; pistillate with 4 sepals, outer 2 smaller; style absent; stigma tufted. **FRUIT** sessile, lenticular, loosely enclosed by inner sepals. Forty-five species, nearly worldwide.

Urtica dioica L. (two houses, each plant containing either male or female flowers) Stinging nettle, ortie. Perennial herbs, 0.5–3 m, rhizomatous, erect or sprawling. **LEAVES** lanceolate to widely ovate, margin serrate, 4–18 cm long; base tapered to cordate, apex acute. **INFL** an elongate panicle or raceme, staminate ascending, pistillate recurved. **FLOWERS**: pistillate lax, with outer sepals 0.8–1.2 mm long, inner sepals 1.4–1.8 mm long; staminate ascending. **FRUIT** 1–1.3 mm long. $2n = 26$. Three species, North America, Mexico, Eurasia. Our two subspecies are indigenous in North America. Nettles have mild diuretic properties. While the medicinal uses have not been verified by modern scientific methods, traditionally the leaves were used in herbal remedies as a cleansing tonic and blood purifier, astringent, antiallergenic, and for insufficient lactation. The root is used in a prostate tonic. Externally, the plant is used to

treat skin complaints, arthritic pain, gout, sciatica, neuralgia, hemorrhoids, and hair problems. The fresh leaves of nettles have been rubbed or beaten onto the skin in the treatment of rheumatism. Termed "urtication," this procedure causes intense irritation to the skin as it is stung by the nettles.

1. Stems and lower leaf blades nearly glabrous, except for a few stinging hairs ..... **subsp. *gracilis***
1' Stems and lower leaf blades densely pubescent ..... **subsp. *holosericea***

subsp. *gracilis* (Aiton) Selander (slender) California nettle. [*Urtica dioica* var. *gracilis* (Aiton) Roy L. Taylor & MacBryde; *U. dioica* var. *procera* (Muhl. ex Willd.) Wedd.; *U. gracilis* Aiton] Riparian, deciduous forests along canyon bottoms to mixed conifer forests. ARIZ: Apa; COLO: Arc, Hin, LPl, Min, Mon, Sln; NMEX: McK, RAr, Sln; UTAH: 1590–3300 m (5100–10800'). Flowering: May–Sep. Widely distributed in North America.

subsp. *holosericea* (Nutt.) Thorne (silky) Stinging nettle. [*Urtica holosericea* Nutt.; *U. dioica* var. *occidentalis* S. Watson] Oak and mixed conifer woodlands. ARIZ: Apa. 2100–3100 m (6900–10000') Flowering: May–Sep. Western United States to northern Mexico.

VALERIANACEAE Batsch VALERIAN FAMILY

Fred Barrie

Perennial, hermaphroditic, dioecious or gynodioecious herbs in our flora, elsewhere occasionally shrubs or annual or biennial herbs, commonly with a distinctive fetid odor, particularly in dried specimens. **LEAVES** opposite, decussate, petiolate or spatulate; simple to pinnatifid or pinnately compound, the bases sometimes sheathing; stipules absent. **INFL** a compound cyme. **FLOWERS** irregular; perfect or unisexual; calyx variously modified or obsolete; corolla sympetalous, often gibbous or spurred, with 5 imbricate lobes; anthers 1 to 4, epipetalous, alternate with the corolla lobes, thecae 2, dehiscing longitudinally; ovary inferior, carpels 3, the 2 abaxial locules sterile, the adaxial locule fertile, bearing a single pendent, anatropous ovule; style 1, stigmas 3. **FRUIT** an achene. A small family with seven genera and approximately 325 species, divided almost equally between the north-temperate regions of North America, Europe and Asia and the montane and temperate regions of Central and South America. The family includes several cultivated genera and species, including *Valerianella* (lamb's lettuce; corn salad), *Centranthus ruber* (red valerian), and *Valeriana officinalis* (garden heliotrope; garden valerian). The latter is the commercial source of valerian root (actually the rhizome), used medicinally and in teas as a calmative. Throughout its range, many *Valeriana* species are used medicinally by indigenous peoples. The rhizome of *Nardostachys jatamansi* (spikenard) is the source of an essential oil used medicinally and in perfumes and incense.

Valeriana L. Valerian

(Latin *valeo*, to be strong, a reference to the medicinal properties of the genus) Perennial herbs (ours), rhizomatous or taprooted, rarely shrubs, occasionally scandent. **INFL** a many-flowered, compound or aggregate dichasium. **FLOWERS** with a calyx of 8–30 plumose setae, inrolled at anthesis, unfurling when the fruit matures to form a pappuslike structure persistent in fruit; corolla rotate to funnel-shaped or tubular, gibbous near the base; the corolla of female flowers commonly 1/3 to 1/2 the size of that of perfect flowers; anthers 3, exserted in perfect flowers, vestigial or absent in female flowers; ovary with the 2 sterile locules reduced or vestigial. **FRUIT** an achene with 3 veins on the abaxial side, 1 on the adaxial side, and 2 along the margin; the pappose calyx persistent (ours) or rarely absent (Meyer 1951; Cronquist et al. 1997b.) *Valeriana arizonica* A. Gray, a species known from montane ponderosa pine parklands from central Arizona to the Guadalupe Mountains in New Mexico and Texas, has been reported as occurring in San Juan County, New Mexico, but the specimens seen that had been identified as such are actually collections of *V. acutiloba*. *Valeriana arizonica* differs most obviously in having truncate leaf bases and perfect flowers with tubular corollas 10–20 mm long.

1. Plants with a taproot ..... **V. edulis**
1' Plants rhizomatous, the roots fibrous ..... (2)

2. Basal leaves 3–14 cm long; corollas of perfect flowers funnelform, 5–9 mm long ..... **V. acutiloba**
2' Basal leaves 10–25 cm long; corollas of perfect flowers rotate, 2–5 mm long ..... **V. occidentalis**

Valeriana acutiloba Rydb. (acutely lobed, referring to the leaves) Plants rhizomatous, gynodioecious, the stems, flowers, and/or fruits lightly pubescent or less commonly glabrous. **STEMS** 20–80 cm, arising from the ends of the rhizome branches. **LEAVES** mostly basal, with 1–3 cauline pairs, the basal leaves 3–14 cm long, simple or less commonly

pinnatifid with 1–3 pairs of reduced lateral lobes, elliptic to narrowly elliptic or oblanceolate, the base cuneate to attenuate, the apex acute, the tip often mucronulate; the cauline leaves reduced, pinnatifid. **INFL** terminal, capitate in flower or with 1–2 pairs of reduced, lateral branches, expanding in fruit. **FLOWER** corolla white or pink, perfect flowers 5–9 mm long, funnel-shaped, female flowers 3–5 mm long, the lobes about 1/3 the length of the tube. **FRUIT** lance-ovate to narrowly oblong, 3–5 mm long; calyx limbs 12–16, about 5 mm long. [*V. capitata* Pall. ex Link subsp. *acutiloba* (Rydb.) F. G. Mey.]. Pine forests and wet meadows. ARIZ: Apa, Nav; COLO: Arc, Con, Dol, Hin, LPl, Min, Mon, RGr, SJn; NMEX: McK, RAr, SJn; UTAH. 1900–3600 m (6500–12000'). Flowering: Apr–Aug. Fruit: May–Sep. Oregon and California east to Montana and New Mexico. Cronquist et al. (1977b) recognized three varieties in *V. acutiloba*, not recognized here, which he described as "geographically distinct but morphologically ill-defined and confluent." Most local populations would fall under **var. *acutiloba*** in his system.

Valeriana edulis Nutt. ex Torr. & A. Gray (edible) Plant taprooted, gynodioecious, glabrous or the leaf margins and/or fruits pubescent. **STEMS** 1–4 from a branching caudex, 0.5–1.5 m tall. **LEAVES** basal or with 1–3 cauline pairs, 10–50 cm long, 0.5–5 cm wide, narrowly elliptic to oblanceolate or obovate-spatulate, occasionally with a weakly defined petiole, margins entire or with 2–10 narrow lobes; basal leaves with the base free or connate-perfoliate, the apex acute; the lobes, when present, linear to oblanceolate, the margins spreading or antrorse-ciliate, rarely glabrous; surfaces glabrous or with scattered simple hairs, restricted to the veins. **INFL** paniculiform, 7–60 cm long. **FLOWERS** perfect or female, white to greenish white or ivory, rotate, corolla 1–5 mm long; stamens 3, weakly to strongly exserted. **FRUIT** tan to purple-maculate, ovate to elliptic, 2–4.5 mm long, calyx limbs 8–14, 5–8 mm long. $2n = 64$. [*V. furfurescens* A. Nelson; *V. trachycarpa* Rydb.]. Wet meadows and alpine valleys. ARIZ: Apa; COLO: Arc, Con, Dol, Hin, LPl, Min, Mon, RGr, SJn, SMg; NMEX: McK, RAr, SJn; UTAH. 1700–3500 m (5900–11600'). Flowering: May–Aug. Fruit: May–Aug. Southern British Colombia east to South Dakota, Colorado, and New Mexico, south to Chihuahua and Nuevo León, Mexico, and in the Great Lakes region from Minnesota to Ohio and Ontario, Canada. The eastern populations, sometimes segregated as var. or subsp. *ciliata*, are morphologically indistinguishable from the western populations. Individuals with perfect flowers rarely set seed and are functionally male. The root of *V. edulis* was eaten by a number of western tribes.

Valeriana occidentalis A. Heller (western) Plant rhizomatous, gynodioecious, glabrous or with a few hairs at the leaf and inflorescence nodes and on the fruits. **STEMS** 40–100 cm tall, arising from the ends of the rhizome branches. **LEAVES** basal and cauline, the basal leaves 10–25 cm long, simple or pinnatifid with 1–4 pairs of lateral leaflets, the blade or terminal lobe elliptic, 4–8 cm long, the base cuneate or rounded, the apex acute, the lateral lobes 1/4–1/2 the size of the terminal lobe and similar in shape; cauline leaves in 1–4 pairs, the lowermost 1–2 pairs often well developed, 5–15 cm long, pinnatifid, the uppermost leaf pairs usually reduced. **INFL** capitate to somewhat conical in flower, expanding in fruit. **FLOWERS** perfect or female, the corolla white, rotate, 2–5 mm long, the lobes approximately equaling the length of the tube. **FRUIT** lanceolate, 3–4 mm long, often purple-maculate, the calyx limbs 10–14, 4–5 mm long. $2n = 64$. Wet meadows; sagebrush, mountain brush, aspen, spruce-fir, sedge, and alpine communities. COLO: Dol, LPl, Min, Mon, SJn; NMEX: RAr; UTAH. 2200–3500 m (7500–11600'). Flowering: May–Aug. Fruit: May–Aug. Northern Idaho and Montana to northwest California, south to Arizona, New Mexico, and Colorado.

VERBENACEAE J. St.-Hil. VERVAIN FAMILY

Susan C. Barber

Annual or perennial, often strongly aromatic. **LEAVES** opposite, simple. **INFL** a spike or spicate raceme. **FLOWERS** zygomorphic, perfect; sepals 5, fused; petals 4 or 5, fused; stamens 4, didynamous; pistil 1, 2-carpellate; ovary superior, 4-lobed, locules 2, but appearing 4-locular due to false septa; placentae 4; axile; style 1, apical; stigma 1, often lobed. **FRUIT** a schizocarp forming 2 or 4 nutlets, enclosed by persistent calyx. $x = 5$ (*Glandularia*) and $x = 7$ (*Verbena*) (Lewis and Oliver 1961). Tropical, subtropical, and temperate distribution. Many tropical species are woody, but temperate species tend to be herbaceous. There are many herbal remedies found in this family. Teakwood (*Tectona grandis*) is one of the most economically important species in the family, which also includes horticulturally important *Vitex*, *Clerodendrum*, and *Lantana*. Circumscription of this family is in question as scientists continue to research the traditional relationships within the Lamiales. Based on a paper by Umber (1979), *Glandularia* is recognized as a segregate genus from *Verbena*. The key is written to reflect the segregation.

1. Fruits of 2 nutlets; corolla 4-lobed, distinctly 2-lipped ..... ***Phyla***
1' Fruits of 4 nutlets; corolla 5-lobed, slightly bilateral ..... (2)

2. Spikes including bracts 10–20 mm wide; calyces 2 times longer than length of nutlets; styles 6–20 mm long; nutlets completely enclosed within closed calyces ..... ***Glandularia***
2' Spikes including bracts 3–8 mm wide; calyces equal to length of nutlets; styles 2–3 mm long; nutlets partially enclosed within open calyces ..... ***Verbena***

Glandularia J. F. Gmel. Mock Vervain

(Latin *gland*, probably referring to the glandular pubescence) Plants annual or perennial herbs; stems often semiwoody; taproots present. **LEAVES** opposite, simple, entire, serrate, lobed, or pinnatifid; pubescence stiff, often glandular. **INFL** a spike, corymbose at anthesis, terminal. **FLOWERS** perfect, zygomorphic; calyces tubular, 5-toothed by vein extensions; corolla salverform, 5-lobed, tube exceeding calyces, blue or purple or lavender or pink or white, fused; minutely barbed hairs inside the tubes; stamens 4, didynamous; style inserted at the top of the ovary. **FRUIT** dry schizocarpic, splitting into 4 1-seeded nutlets, usually black at maturity; commissural faces typically covered with papillae, outer surface reticulate. A New World genus of mesic to desert habitats. Origins are thought to be South American, where many species are thought to be undescribed. Hybridization is common. $n = 5, 10, 15, 20$.

Glandularia bipinnatifida (Nutt.) Nutt. (twice split) Plants annual or perennial, prostrate, decumbent to ascending, often rooting at the lower nodes, branched from base, pubescent, not glandular. **STEMS** 5–60 cm tall, hispid-hirsute. **LEAVES** petiolate, deeply incised to bipinnatifid, lobes linear to oblong, hirsute, appressed on both abaxial and adaxial surfaces, 2–6 cm long, 1–6 cm wide. **INFL** a pedunculate spike, short at anthesis, elongating at maturity; bractlets longer than the calyces. **FLOWER** corolla pink to lavender or purple, limb 7–10 mm wide, lobes emarginate, producing nectar; calyces 7–10 mm long, lobes unequal, hispid-hirsute. **FRUIT** 4 subcylindric, 1-seeded nutlets, 3 mm long. $n = 10, 15$. (*Verbena bipinnatifida* Nutt.). Widespread along roadsides, prairies, meadows, dry plains, pastures, and in ponderosa pine communities. COLO: Arc, LPl, 1980–2285 m (6500–7500'). Flowering Mar–Oct. Widespread from California east to Georgia, Texas north to South Dakota.

Phyla Lour. Frog-fruit

(Greek *phyle*, a clan or tribe, referring to the many flowers in a head) Perennial, erect or prostrate herbs with trailing or ascending stems, often woody at the base, glabrate to canescent-strigulose. **LEAVES** opposite, dentate apically. **INFL** axillary, pedunculate, a dense subglobose to cylindric spike. **FLOWERS** sessile, small, borne singly in axils of cuneate-obovate bractlets.

Phyla nodiflora (L.) Greene (flowers from nodes) Common frog-fruit. Plants perennial herbs. **STEMS** rooting at the nodes, prostrate or ascending. Stem hairs malpighian and canescent. **LEAVES** opposite, 17–20 mm long, 6–25 mm wide, spatulate or obovate or oblanceolate to elliptic, broadest above the middle, tapering into a petiole, sharply serrate above the middle, glabrous or strigillose-puberulent. **INFL** a densely flowered, pedunculate, axillary spike, globose when young, becoming cylindrical and greatly elongated in fruit, peduncles longer than leaves in fruit, up to 12 cm long. **FLOWERS** sessile, single in axils of bractlets, bractlets imbricate; corolla rose or purple or white, often with a yellow center, 2–2.5 mm long, corolla tube slightly exserted from calyces; stamens 4, paired; ovaries with 2 1-celled

chambers, stigmas thickened. **FRUIT** 2 nutlets, included in and sometimes adnate to calyces. Moist soils, typically disturbed. NMEX: McK. 1675–1980 m (5500–6500'). Flowering: May–Oct. California to Texas; South America.

Verbena L. Vervain

(Latin name for any of certain sacred boughs) Plants annual or perennial herbs, prostrate, procumbent, ascending, or erect; glabrous or variously pubescent. **LEAVES** opposite, dentate or variously lobed, incised, or pinnatifid. **INFL** a spike, terminal, usually densely many-flowered, but sometimes greatly elongate and sparsely flowered. **FLOWERS** perfect, zygomorphic, 5-lobed, in the axil of a bract, corolla salverform or funnelform, blue or purple or lavender or pink or white, fused; calyces tubular, 5-angled, 5-ribbed, 5-toothed; stamens 4, didynamous, inserted in the upper 1/2 of the corolla tube, usually included; anthers ovate. **FRUIT** a dry schizocarp splitting into 4 1-seeded nutlets. A New World genus mostly of temperate and tropical America. Origins are thought to be North American. Hybridization is common. $n = 7, 14, 21$.

1. Bracts longer than the calyx tubes, reflexed at maturity; plants prostrate; leaves deeply incised to pinnatifid or cleft ..... ***V. bracteata***

1' Bracts equal to or shorter than the calyx tubes, erect at maturity; plants erect; leaves serrate-dentate..... ***V. macdougalii***

Verbena bracteata Lag. & Rodr. (with bracts) Plants prostrate or decumbent perennial (can flower as an annual). **STEMS** 9–55 cm tall; coarsely hirsute. **LEAVES** usually 3-lobed, the central lobe cuneate-obovate and larger than the other 2, rarely pinnately incised, narrowed into a petiole 2–20 mm long, hirsute. **INFL** a terminal spike, sessile, 5–15 cm long, 2–10 mm wide, bracts 8–15 mm long, conspicuous, much longer than the calyx, recurved at maturity, coarsely hirsute. **FLOWER** corolla bluish to lavender or purple, inconspicuous, limb to 3 mm wide, tubes slightly exserted, calyces 3–4 mm long. **FRUIT** 4 subcylindric, 1-seeded nutlets, 2–2.5 mm long. $n = 7, 14$. [*V. imbricata* Wooton & Standl.]. Disturbed areas throughout North America; widespread. ARIZ: Apa, Nav; COLO: Arc, Dol, LPl, Min, Mon, SJn, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1125–2285 m (3700–7500'). Flowering: Apr–Oct. Widely distributed in North America and Mexico. Hybridizes readily with several species.

Verbena macdougalii A. Heller (for Daniel T. Macdougal, plant physiologist) Plants perennial. **STEMS** erect, to 1 m tall; villous-hirsute with spreading hairs. **LEAVES** short-petiolate or narrowed into a subpetiolar base, blade oblong-elliptic to ovate, 6–10 cm long, coarsely and prominently rugose, irregularly serrate-dentate. **INFL** a spike, typically solitary or in 3s, 7–10 mm wide, compact, hirsute; bracts usually longer than the calyx. **FLOWER** calyx 4–5 mm long, densely pubescent, obtuse lobes with subulate teeth; corolla deep purple, barely exserted, limbs 6 mm wide; **FRUIT** 4 1-seeded, trigonous nutlets, 2.5 mm long. $n = 7$. Mountain meadows and ponderosa pine forests. ARIZ: Apa; COLO: Arc, LPl; NMEX: RAr, SJn. 1850–2300 m (6070–7545'). Flowering: Jun–Oct. Colorado and Wyoming west to Utah and south to Arizona and New Mexico.

VIOLACEAE Batsch VIOLET FAMILY

R. John Little

Treelike, small shrubs, vines, or herbs (ours), perennial or annual. **LEAVES** simple, entire to deeply lobed or compound. **INFL** axillary from upper leaf axils or scapose from rhizome; flowers solitary in ours or in racemes. **FLOWERS** perfect, zygomorphic in ours; sepals 5, the base of sepals auriculate (with earlike lobes) or not; petals 5, the base of lower petal elongated into a spur or gibbous (swollen); stamens 5, alternate with petals, surrounding the ovary, the filaments short, wide, the 2 lowest anthers often with nectaries at their base extending into the spur; pistil 1, the ovary superior, unilocular, carpels 3–5, the placentae parietal, the ovules 1–2 or numerous on each placenta, anatropous, the style 1. **FRUIT** a capsule in ours, loculicidal, sometimes explosively dehiscent. **SEEDS** usually arillate. Twenty-three genera, 830 species. Chiefly temperate, subtropical, and tropical regions worldwide. Cultivated species of horticultural importance include *Viola tricolor* L. (Johnny jump-up) and *V.* ×*wittrockiana* Gams (pansy) (Baker 1957; Ballard 1992; Clausen 1964; Davidse 1976; Fabijan, Packer, and Denford 1987; Little 2001; McKinney 1992).

Viola L. Violet

(Latin *viola*, classical name) Caulescent or acaulescent annual or perennial herbs. **LEAVES** simple, dissected or compound; basal, cauline, or both, stipulate, petiolate, alternate or lower sometimes opposite. **INFL** axillary or scapose, flowers solitary. **FLOWERS** zygomorphic; sepals subequal, auriculate at base; petals unequal; lower petal shorter or

longer than others, the base elongated into a spur or gibbous; lateral 2 petals equal, usually spreading, usually bearded (with hairs) at base; upper 2 equal, erect or reflexed; lower 2 stamens with nectaries projecting into the spur. **FRUIT** a 3-valved, 1-celled capsule, ovoid to oblong, glabrous or hairy; apetalous, cleistogamous flowers present in many species. **SEEDS** about 15–20, usually ovoid, many species arillate with a prominent caruncle by which they are ant-dispersed (myrmecochory). About 400 species worldwide in temperate areas. Flower color should be recorded when collected because petal colors fade in specimen preparation and storage.

1. Plant with branched stems (caulescent); petioles arise from lower and upper stem nodes ..... (2)
1' Plant with unbranched stems (acaulescent); petioles arise only from rootstalk or rhizome ..... (5)

2. Flower violet or blue ..... ***V. adunca***
2' Flower white or yellow ..... (3)

3. Flower white ..... ***V. canadensis***
3' Flower yellow ..... (4)

4. Lower petal (including spur) 6–13 mm; glabrous to minutely puberulent; capsule 4–9 mm, seed caruncle usually a narrow row of tissue beginning at the micropyle (narrow end of seed), flattened perpendicular to the seed and forming a sharp edge, covering 1/3 to entire length of seed ..... ***V. nuttallii***
4' Lower petal (including spur) 12–20 mm; glabrous to very hairy; capsule 6–13 mm; seed caruncle a globular to variously shaped mass of tissue near the micropyle, covering about 1/3 length of seed ..... ***V. praemorsa***

5. Plant with divided leaves; dry habitats ..... ***V. pedatifida***
5' Plant with entire leaves; wet habitats ..... (6)

6. Plant mat-forming, with stolons; petals white ..... ***V. macloskeyi***
6' Plant erect, not mat-forming, without stolons; petals blue ..... ***V. sororia***

Viola adunca Sm. (hooked) Western dog violet, hooked violet, early blue violet, sand violet. Perennial herb 2–30 cm tall. **STEMS** branched, at first short, usually elongating later in season, glabrous to variously pubescent, clustered on thin, usually vertical, woody rootstalks. **LEAVES** simple, basal and cauline, glabrous to pubescent; basal leaf petiole 5–70 mm long, blade ovate to ovate-triangular, 5–47 mm long to 4.5 cm wide, base cordate, truncate, or attenuate; cauline petioles winged, leaves margins usually crenate, often entire in *V. adunca* var. *bellidifolia*, apex acute to obtuse; cauline petioles winged, leaves similar to basal but usually smaller, blade 6–42 mm long to 3.3 cm wide. **INFL** axillary from upper leaf axils, pedicels to 10.3 cm long. **FLOWER** sepals to 10 mm long, auricles usually small; petals pale to deep violet, the lower 3 purple-veined, white-bearded at the base, the lateral pair white-bearded at the base, the lowest petal (including spur) 7–20 mm long, the spur usually elongated, conspicuous, straight, curved, pointed, or hooked at tip, 1–15 mm long to 3 mm wide. **FRUIT** 6–11 mm long, glabrous. $2n = 20$. [*V. adunca* var. *ashtoniae* M. S. Baker; *V. adunca* var. *oxyceras* (S. Watson) Jeps.; *V. adunca* var. *uncinulata* (Greene) C. L. Hitchc.]. Alaska south to Canada, west to the eastern United States. A highly polymorphic species with many named variants. Two subspecies recognized in our area; they are often confused with *V. sororia* subsp. *affinis*, an acaulescent species that lacks branching stems, and *V. labradorica* Schrank, a mostly glabrous species that lacks winged petioles and does not occur in our area.

1. Plant 3.5–30 cm tall; basal leaf blades 1.3–4.8 cm long, 1.2–3.3 cm wide; cauline leaf blades 1.2–4.2 cm long, 1.1–3.3 cm wide; lower petal (including spur) 9–20 mm long; pedicels 2.9–10.3 cm long ..... **var. *adunca***
1' Dwarf plant 1.8–6.5 cm tall, appearing acaulescent; basal leaf blades 0.5–1.7 cm long, 4–14 mm wide; cauline leaf blades 6–14.5 mm long, 4–14 mm wide; lower petal (including spur) 7–14 mm long; pedicels to 5 cm long; known only from Colorado in our area ..... **var. *bellidifolia***

var. *adunca* Damp banks, meadow edges in coniferous forests, usually in shade. ARIZ: Apa. COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: RAr, SJn; UTAH. 3050–3750 m (7600–10000'). Flowering: May–Aug. New Brunswick to Alaska, south to Vermont, New Mexico, and California.

var. *bellidifolia* (Greene) H. D. Harr. (with beautiful leaves) Subalpine meadows to alpine tundra, above 3050 m (10000'). COLO: Arc, Hin, LPl, Min, Mon, RGr, SJn. Flowering: late Jun–early Aug. British Columbia south to Colorado.

Viola canadensis L. (of Canada) Canada violet, tall white violet. Perennial herb 3–38 cm tall. **STEMS** erect, branched above, glabrous to puberulent, from vertical or horizontal rhizomes, or stolons. **LEAVES** simple, basal and cauline, with sparse hairs along major veins or not, the margins ciliate or not; basal leaf petioles 1–14.8 cm long, puberulent,

blades ovate-reniform, 0.7–7.5 cm long to 9.2 cm wide, base cordate, margins serrate, apex acuminate to acute; cauline petioles 0.4–9.6 cm long, blades ovate to triangular, 1–6.5 cm long to 5.8 cm wide, base cordate, truncate, or attenuate, margins serrate, apex acute. **INFL** axillary from upper leaf axils, pedicels to 6 cm long, glabrous to puberulent. **FLOWER** sepals to 9 mm long; petals white, the lower 3 with yellow at base or not, purple-veined, the lateral pair white-bearded, the outer side of petals often purple-tinged, the lowest petal (including spur) 5.5–15 mm long, the spur short, gibbous. **FRUIT** 3–10 mm long, glabrous. $2n = 24$. A complex group in need of study, consisting of about five subspecies, two in our area.

1. Plant 11–38 cm tall, not tufted; basal leaf blades 2.4–7.5 cm long, 2.2–9.2 cm wide; cauline blades 2.5–6.5 cm long, 9–58 mm wide; lowest petal (including spur) 11–15 mm long; pedicels 1.4–6 cm long.....**var. *canadensis***
1' Plant 3–18 cm tall, tufted; basal leaf blades 0.7–3.1 cm long, 0.9–3.8 cm wide; cauline blades 1–2.8 cm long, 8–70 mm wide; lowest petal (including spur) 5.5–9 mm long; pedicels 0.9–3.1 cm long.....**subsp. *scopulorum***

var. *canadensis* [*V. muriculata* Greene; *V. canadensis* var. *neomexicana* (Greene) House]. Riparian habitats in coniferous or aspen forests, or moist, shaded slopes, in sandy, rich, or rocky soil, roadcuts. ARIZ: Apa, Coc, Nav; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: RAr, SJn; UTAH. 1310–3540 m (4300–11600'). Flowering: Apr–Oct. Alaska south to British Columbia, Washington, Oregon, east to Labrador, south through the Rocky Mountains, Idaho to Mexico, to the eastern United States except Texas, Louisiana, Alabama, and Florida.

subsp. *scopulorum* (A. Gray) House (of the rocks) [*V. scopulorum* (A. Gray) Greene]. Damp, wooded sites. ARIZ: Apa; COLO: Arc, Hin, Min, Mon, SJn. 2285–3505 m (7500–11500'). Flowering: Apr–Oct. Arizona, Colorado, and New Mexico.

Viola macloskeyi F. E. Lloyd (for G. Macloskey) Macloskey's violet, wild white violet, smooth white violet. Perennial herb 2.5–22 cm tall, forming a dense patch. **STEMS** none; plants arise from thin, creeping rhizomes that form late-season stolons in a dense patch. **LEAVES** simple, basal, erect; stipules reddish; petioles 2–17 cm long, blades round to ovate, base cordate to truncate, blades 1–6.5 cm long, about as wide, margins entire, crenate, or crenate-serrate, apex obtuse, rarely acute, glabrous to hairy, thin. **INFL** scapose from rhizomes, pedicels to 21 cm long, sometimes reddish when mature. **FLOWER** petals white, the tips acute, the lower 3 petals with purple veins, the lateral pair usually white-bearded; the lowest petal (including spur) 6–17 mm long, lateral petals twisted at base, upper often reflexed backward; sepal lobes 1–2 mm long, earlike. **FRUIT** 5–9 mm long, glabrous. $2n = 24$. [*V. blanda* Willd. var. *macloskeyi* (F. E. Lloyd) Jeps.]. Bogs, wet meadows, seeps, lake margins, streamsides, floodplains, and mesic roadside depressions, often growing among mosses. COLO: Hin, SJn. 2190–3600 m (7200–11850'). Flowering: May–Jul. Circumboreal, northern Europe and Asia, Alaska to Labrador, Washington to southern California, east to Arizona, Colorado, New Mexico, New England. A variable species needing study. Plants with inconspicuously crenate leaves, usually less than 2.5 cm wide, have been called subsp. *macloskeyi*; plants with prominently crenate leaves often over 2.5 cm wide have been called subsp. *pallens* (Banks ex DC.) M. S. Baker. Although occurring in all adjacent states, there are no Utah records. Often confused with *V. palustris* L., which has pale blue to almost white flowers, but does not form dense patches.

Viola nuttallii Pursh (for Thomas Nuttall) Nuttall's violet. Perennial herb 2–27 cm tall. **STEMS** branched, clustered on short, vertical rootstalks, at first short, usually elongating later in season, erect to spreading or compressed, suberect in shade, depressed in sun; usually partly buried; upper stems usually puberulent, the lower glabrate. **LEAVES** simple, basal and cauline, glabrous to puberulent; basal leaf petioles 1.9–17 cm long, basal blades lanceolate, ovate, or elliptic, 1–9 cm long, 6–25 mm wide, base attenuate, margins entire, sinuate, or subserrate, ciliate, apex obtuse to acute; cauline leaf petioles 7–70 mm long, blades ovate, lanceolate to elliptic, 1.4–7.2 cm long to 18 mm wide, base attenuate, margins entire, sinuate, or subserrate, apex acute. **INFL** axillary from upper leaf axils, pedicels to 13 cm long. **FLOWER** sepals linear, acute, to 8 mm long, auricles with or without pubescence; petals yellow on the face, the lower 3 brown- to purple-veined, the upper 2 usually brownish purple on back, the lateral pair bearded; the lowest petal (including spur) 6–13 mm long, the spur gibbous. **FRUIT** 4–9 mm long, glabrous. **SEED** caruncle usually a narrow row of tissue beginning at the micropyle (narrow end of seed), flattened perpendicular to the seed and forming a sharp edge, covering 1/3 to entire length of seed. $2n = 24$. Sagebrush flats and piñon-juniper woodlands. ARIZ: Apa; COLO: Arc, LPl, Mon; NMEX: SJn. 1870–2550 m (6150–8400'). Flowering: Apr–Jun. Southern Alberta, Saskatchewan, and Manitoba, Canada; Idaho, Utah, Montana, Minnesota, North Dakota, South Dakota, Wyoming, Nebraska, and Kansas.

Viola pedatifida G. Don (leaves cleft like a bird's foot) Prairie violet, larkspur violet, crowfoot violet. Perennial herb 4–30 cm tall. **STEMS** none; plants arising from a short, vertical, fleshy rhizome, glabrous to sparsely strigose. **LEAVES** basal, erect, glabrous to short-hirsute, margins ciliate; petioles 3–16 cm long; blades palmately divided into 5–9 linear, spatulate, obovate, or falcate segments, each cleft or parted toward apex; 2.3–4.5 cm long, 3.5–7.3 cm wide, bases

truncate, reniform, or cordate, apices obtuse, acute to mucro-tipped. **INFL** scapose from rhizome, pedicels to 18 cm long; chasmogamous and cleistogamous peduncles ascending to erect. **FLOWER** sepals to 7 mm long, auricles up to 1/2 as long as sepals; petals light to dark blue-violet on face, the lower 3 bearded, the lowest petal (including spur) 13–25 mm long. **FRUIT** 8–13 mm long, elliptic, glabrous. $2n = 54$. Normally of prairie or grassy habitats, rarely in open woods (as in Arizona). COLO: Arc, Hin, 1770–2380 m (5800–7800'). Flowering May Jun. Southern Alberta east to southern Ontario, south to Ohio and west to Colorado and Arizona. Two subspecies, ours are **subsp. *pedatifida***

Viola praemorsa Douglas ex Lindl. (bitten on the end) Astoria violet. Perennial herb 6–30 cm tall. **STEMS** usually several, spreading from a mostly vertical, woody rootstock; appearing stemless early in season, but later elongating. **LEAVES** simple, basal and cauline, glabrous to very hairy with 1 mm wavy hairs; basal petioles to 19.2 cm long, usually longer than blades, blades narrow to broadly ovate, oblong-lanceolate, or narrow to broadly elliptic, 2.4–12.5 cm long, to 6.7 cm wide, base attenuate or truncate, sometimes oblique, margins usually irregularly crenate/serrate, sometimes entire or wavy, apex acute or obtuse; cauline petioles to 13.5 cm long, blades similar to basal, 1.9–14.3 cm long, to 5.3 cm wide, much longer than wide. **INFL** axillary from upper leaf axils, pedicels to 19.5 cm long, shorter or longer than leaves. **FLOWER** petals deep yellow, lower and lateral veined brown-purple, the lateral pair bearded, the backs of the upper 2 often colored maroon or brownish due to numerous colored veins, the lowest petal (including spur) 12–20 mm, the spur short, blunt. **FRUIT** 6–13 mm long, glabrous to hairy. **SEED** caruncle a globular to variously shaped mass of tissue near the micropyle (narrow end of seed), covering about 1/3 length of seed. $2n = 36, 48$. [*V. linguifolia* Nutt.; *V. nuttallii* Pursh var. *praemorsa* (Douglas) S. Watson; *V. nuttallii* subsp. *praemorsa* (Douglas) Piper; *V. nuttallii* var. *linguifolia* (Nutt.) Piper; *V. nuttallii* subsp. *linguaefolia* Piper; *V. praemorsa* subsp. *major* (Hook.) M. S. Baker] Various habitats, moist to dry soil, grassy slopes, meadows, yellow pine forests. COLO: SJn, 3810 m (12500'). Flowering Jun. Saanich Peninsula of Vancouver Island south to California, southwest Alberta, south to Idaho, western Montana, Utah, Nevada, Wyoming. A complex group needing study; three subspecies; ours are **subsp. *linguifolia*** (Nutt.) M. S. Baker. One record from summit of Cinnamon Pass Road, Colorado.

Viola sororia Willd. (sisterly, as in resembling other species) Common blue violet, woolly blue violet, downy blue violet. Perennial herb 2–50 cm tall. **STEMS** none; plants arising from short, thick, fleshy rhizomes with long, fibrous roots. **LEAVES** simple, all basal; basal petioles 1.8–23 cm long, midseason blades cordiform, reniform, to very widely ovate, 2–5.5 cm long to 10 cm wide, base cordate to reniform, margins uniformly serrate/crenate, ciliate or not, apex acute to slightly caudate, glabrous to strigose throughout. **INFL** scapose from rhizome, pedicels to 5.25 cm long. **FLOWER** sepals to 8 mm long, petals light to dark blue-violet, the lower 3 purple-veined, the lateral pair white-bearded; the lowest petal spurred or not, 10–20 mm long (including spur), the spur blunt, straight, 1.5 mm long, 3 mm wide; sepal auricles of cleistogamous flowers elongated or not. **FRUIT** 5–12 mm long, elliptic, glabrous. $2n = 54$. [*V. nephrophylla* Greene; *V. nephrophylla* var. *arizonica* (Greene) Kearney & Peebles; *V. nephrophylla* var. *cognata* (Greene) C. L. Hitchc.; *V. papilionacea* Pursh] In wet or damp soil along creeks, streams, and shady hillsides of coniferous forests, prairies, pastures, marshes, mossy bogs, gravelly shores. ARIZ: Apa, Nav; COLO: Arc, Hin, LPl, Min, Mon, SJn; NMEX: McK, SJn; UTAH: 1370–3000 m (4500–9850'). Flowering: Mar–Sep. Alaska, throughout Canada, south throughout the western United States, east through Iowa and Wisconsin to the New England states. Four subspecies; ours are **subsp. *affinis*** (Leconte) R. J. Little (similar to). Often confused with *V. adunca*, which has branching stems, flowers in upper axils, and woody roots. Plant (cited as *V. nephrophylla*) used as a ceremonial emetic by the Ramah Navajo.

VISCACEAE Batsch MISTLETOE FAMILY

John R. Spence

Aerial parasites on branches or trunks of host, producing haustoria that penetrate the host, dioecious or monoecious "subshrubs," with or without chlorophyll. **STEMS** brittle, disarticulating at nodes, branching verticillate to flabellate-dichotomous, variously colored red-brown, orange, olive, green, or yellow, glabrous or sometimes pubescent when young, nodes swollen. **LEAVES** opposite, reduced (ours), evergreen, scalelike, entire, glabrous, free or connate at base; stipules absent. **INFL** an axillary bracteate spike or cyme or flower solitary. **FLOWERS** actinomorphic, epigynous, unisexual, 3-merous (carpellate flowers) or 2–4-merous (staminate flowers), sessile or short-pedicellate, subtended by a scalelike bract; perianth of 1 whorl, tepals yellow or green, often reduced to teeth; stamens of staminate flowers 4, adnate to and opposite tepals, anthers with 1–2 thecae, filaments short or absent, carpellate flowers lacking stamens; ovary of 3–4 carpels, with 1 locule, style short or absent, stigma short; staminate flowers sometimes nectariferous. **FRUIT** a fleshy drupe or berry, sessile or on a straight to curved pedicel, often brightly colored, sometimes dehiscing

explosively, seed 1 (2), lacking a testa, surrounded or capped at one end by sticky fleshy material. A small family of eight genera and about 450 species, distributed worldwide but most common in the tropics and subtropics. The mistletoes are related to the Santalaceae (sandalwood family), also parasites. Recent research has tended to place Viscaceae within the Santalaceae, although the interrelationships of these and other families such as the Loranthaceae are complex and only partially resolved at present. The Eurasian genus *Viscum* is the traditional Christmas mistletoe and is a sacred plant of Druids. Mistletoes can seriously affect host plant growth and survival and can eventually kill the host. Dwarf mistletoes (*Arceuthobium*) are widespread and can cause significant damage to western coniferous forests.

1. Parasitic on Pinaceae (*Pinus* or *Pseudotsuga* in ours); perianth of pistillate flowers 2-merous; anthers unilocular; fruit blue-green or blue-purple, compressed, on a recurved pedicel ..... ***Arceuthobium***
1' Parasitic on Cupressaceae (*Juniperus* in ours) and on angiosperms; perianth of pistillate flowers 3-merous; anthers bilocular; fruit white or pink, globose, sessile, pedicel straight or recurved ..... ***Phoradendron***

Arceuthobium M. Bieb. Dwarf Mistletoe

(Greek *arceuthos*, juniper, + *bios*, life) Aerial, parasitic, dioecious subshrub, with chlorophyll, on branches or trunks of host. **STEMS** mostly erect or rarely pendent, brittle, disarticulating at nodes, round to sometimes square or angled, branching dichotomous and flabellate, variously colored red-brown, olive, green, orange, or yellow, glabrous, nodes swollen. **LEAVES** reduced to opposite connate scales. **INFL** an axillary bracteate spike of numerous flowers. **FLOWERS** 3- or 4-merous (both carpellate and staminate flowers), sessile or pedicellate; perianth of staminate flowers (2) 3–4 (7) inconspicuous persistent tepals, often reduced to teeth; anthers sessile, adnate to tepals, with 1 theca; ovary of carpellate flowers fused with perianth, forming a bilobed cap. **FRUIT** a pedicellate, fleshy, bicolored berry, pale tan to brown above, glaucous, blue or blue-purple below, capped by persistent tepals, dehiscing explosively, pedicel erect to recurved when mature, seeds 1, mucilaginous. A small genus of either 26 or 42 species, distributed on members of the Pinaceae and Cupressaceae in North America, Eurasia, and Africa (Hawksworth and Wiens 1996; Nickrent et al. 2004). Hawksworth and Wiens (1996) recognized 42 species of *Arceuthobium*, with 8 species endemic to the Old World and the remainder endemic to the New World. Species are morphologically highly variable and difficult to distinguish; hence there has been an over-reliance on hosts to define them. Nickrent et al. (2004), based on a phylogenetic analysis of DNA sequences, recognized 26 species, all 8 of the Old World species and 18 in the New World. The *A. campylopodum* complex was reduced in their study to two species, *A. cyanocarpum*, with multiple hosts, and *A. divaricatum*, primarily infesting piñon pines. Morphological diversity in the genus does not appear to be strongly correlated with DNA sequence divergence, suggesting potential recent dispersal and minor ecotypic differentiation on different hosts. The fruits of *Arceuthobium* species split open explosively, throwing seeds as far as 50 feet. The seeds are coated with a viscous substance that acts as a cement, attaching the seeds to leaves and branches of the host. After a rain, the cement of seeds attached to needles hydrates and lubricates, causing the seeds to slide toward the needle bases, where they germinate. They can also germinate directly on young twigs if the bark is not too thick. Seeds are consumed by wildlife, and many stick to the feathers and feet of birds, allowing them to be dispersed large distances. The Navajo make a tea of the stems that is used in various ceremonies. All species, however, are probably at least slightly toxic.

1. Carpellate plants small, less than 4 cm tall, stems yellow-green to olive-green; parasitic on *Pseudotsuga menziesii* (Douglas-fir) ..... ***A. douglasii***
1' Carpellate plants typically larger, often >5 cm tall; stems yellow, brown, orange, or green; parasitic on *Pinus* (pines) ..... (2)

2. Stems yellow-orange to orange-brown; plants flowering in spring; parasitic on *Pinus ponderosa* or rarely *P. contorta* (lodgepole pine) ..... ***A. vaginatum***
2' Stems dull brown or green to olive-green, lacking orange or yellow tints; plants flowering in late summer; parasitic on *Pinus edulis* (piñon pine) ..... ***A. divaricatum***

Arceuthobium divaricatum Engelm. **CP** (strongly spreading-branching) Piñon dwarf mistletoe. Aerial parasitic subshrub on branches and rarely the trunks of piñon pine, not or rarely producing systemic witches'-brooms. **STEMS** 5–10 cm long, central one 1.5–4 mm thick at base, strongly branching, opposite branches often strongly divergent, divaricate and flabellate, dark green to olive-green or brown, lacking yellow tints, third branch internode 5–7 times as long as thick. **FLOWERS** the same color as shoots; staminate flowers 2–3 mm across, tepals 3, unequal, 2 somewhat

asymmetrically keeled and hooded, the third innermost flat and deflexed at anthesis. **FRUIT** brown above, glaucous blue below, 3–4 mm long, 2 mm wide, elliptic, on a short, erect to recurved pedicel. Common on *Pinus edulis* (piñon pine). ARIZ: Apa, Nav; COLO: Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1525–2130 m (5000–7000'). Flowering: Jul–Sep. Fruit: Sep–Oct of following year. This species is most closely related to *A. vaginatum*, which differs in its reddish to orange-yellow shoots, and spring flowering.

Arceuthobium douglasii Engelm. (for David Douglas, 1798–1834, botanical explorer) Douglas-fir dwarf mistletoe. Aerial parasitic subshrub on branches and trunks of *Pseudotsuga menziesii*, commonly forming systemic witches'-brooms. **STEMS** 0.3–5 cm, central ones 1–1.5 mm thick at base, branching divaricate and flabellate, yellow-green to olive-green, third branch internode 3–4 times as long as thick. **FLOWERS** same color as shoots on outside, staminate flowers 2–3 mm across, tepals 3, purple to red on inside, equal to subequal, somewhat asymmetrically keeled, spreading at anthesis. **FRUIT** olive-green throughout, 3–5 mm long, 1.5–2.5 mm wide, obovate, on short, erect to recurved pedicel. Common on *Pseudotsuga menziesii* (Douglas-fir). ARIZ: Apa. COLO: Arc, Hin, Min, Mon. NMEX: SJn. UTAH. 2320–2750 m (7000–9000'). Flowering: Apr–May. Fruit: Aug–Sep of following year.

Arceuthobium vaginatum (Willd.) J. Presl (*vagina*, sheath, for the persistent tepals sheathing the ovary) Southwestern dwarf mistletoe. Aerial parasitic subshrub on branches and trunks of pines, primarily *Pinus ponderosa* but also *P. contorta*, sometimes forming systemic witches'-brooms. **STEMS** 5–25 cm long, central ones 3–8 mm thick at base, branching divaricate and flabellate, yellow-orange, dull reddish brown or sometimes nearly black, third branch internode 2–3 times as long as thick. **FLOWERS** same color as shoots, staminate flowers 2–3 mm across, tepals 3, unequal, 2 somewhat asymmetrically keeled and hooded, the third innermost flat and deflexed at anthesis. **FRUIT** brown or tan above, glaucous blue below, 4–6 mm long, 2–3 mm wide, elliptic, on a long, strongly recurved pedicel. [*A. cryptopodum* Engelm.]. Our material belongs to **var. *cryptopodum*** (Engelm.) Cronquist (hidden foot). Common on *Pinus ponderosa*, rare on *P. contorta* (lodgepole pine). ARIZ: Apa; COLO: Arc, Dol, Hin, LPl, Min, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 2320–2750 m (7000–9000'). Flowering: May–June. Fruit: Aug–Sep of following year. Used as a ceremonial medicine by the Ramah Navajo.

Phoradendron Nutt. Mistletoe

(Greek *phor*, thief, + *dendron*, tree) Aerial, parasitic, dioecious subshrub, with chlorophyll, on branches of host. **STEMS** erect to pendent, brittle, disarticulating at nodes, round to sometimes square or angled, branching dichotomously, variously colored red-brown, green, or yellow, glabrous or pubescent when young, nodes swollen. **LEAVES** well developed to scalelike (ours), free or connate at base. **INFL** an axillary bracteate spike, carpellate spike reduced to 2 flowers, staminate spike with 2–many flowers. **FLOWERS** 3- or 4-merous (both carpellate and staminate flowers), sessile; perianth of 3–4 inconspicuous persistent tepals, often reduced to teeth, anthers sessile, adnate to tepal, with 2 thecae; ovary fused with perianth. **FRUIT** a brightly colored, sessile, fleshy, drupelike berry, white, white-pink to red, capped by persistent tepals, on straight or recurved pedicel, not dehiscing explosively, seeds 1. A large genus of 235 species, endemic to the New World, with a large concentration in the tropics and subtropics. Mistletoes are distributed by birds, who consume the fruits and either wipe the seed off with their bills or void the seed on perches. Although only a single species occurs in the flora, several others approach our area from the south, including *P. bolleanum* (parasitic on Cupressaceae), *P. californicum* (parasitic on Fabaceae and *Larrea*), and *P. flavescens* (parasitic on various riparian angiosperm trees), and may eventually be found in the Four Corners region on planted hosts.

Phoradendron juniperinum A. Gray (on *Juniperus*) Juniper mistletoe, taa'tshaa'. Aerial parasitic subshrub on branches of host. **STEMS** brittle, 5–20 cm long, somewhat angular, branching dichotomous to irregular, often branching flattened in 1 plane, green, olive, or yellow-green, glabrous, somewhat shiny. **LEAVES** 0.5–1.5 mm long, triangular, acute, erect to somewhat recurved. **INFL** an axillary spike or cyme, carpellate inflorescence reduced to 1 segment with 2 flowers, staminate inflorescence of 4–10 flowers. **FLOWERS** inconspicuous, sessile, tepals 3 (4), 0.5–2 mm, pale yellow to green. **FRUIT** a shiny, somewhat translucent, white, pink, or pale red berry, 3–5 mm, elliptic to globose, on recurved pedicel, capped by pale, persistent, erect tepals. Common on *Juniperus osteosperma* (Utah juniper), *J. monosperma* (single-seed juniper), and *J. scopulorum* (Rocky Mountain juniper). ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon, SMg; NMEX: McK, RAr, San, SJn; UTAH. 1675–2460 m (5500–8200'). Flowering: Jul–Aug. Fruit: Aug–Oct. This species is reported to rarely parasitize *Pinus edulis* (piñon pine). The Navajos ate the berries, produced a medicinal tea from the branches, and used the plant in ceremonies, such as hanging the plant at the entrance to the hogan to ward off lightning. The Hopi used the plant to make a tea as a gastrointestinal aid and used the branches as a textile dye.

VITACEAE Juss. GRAPE FAMILY

John R. Spence

Woody vines, sprawling or climbing over other vegetation, unarmed. **STEMS** often with lenticels; tendrils opposite the leaves, weakly or strongly branched, with or without adhesive discs. **LEAVES** alternate, blade petiolate, simple to palmately lobed or compound, glabrous to pubescent, deciduous or sometimes persistent; stipules deciduous. **INFL** terminal or lateral opposite the leaves, cymose, umbellate, or paniculate. **FLOWERS** inconspicuous, perfect or unisexual, regular, hypogynous, 4- or 5-merous; calyx small, toothed or lobed or occasionally reduced, free or connate; corolla valvate, petals distinct below, sometimes coherent above; stamens distinct, as many as petals and opposite; nectar disc present between stamens, annular to distinctly lobed; ovary superior, carpels and locules 2, united, style simple or sometimes absent, stigma discoid to capitate, ovules 2, basally attached. **FRUIT** a fleshy to dry berry. **SEEDS** 2–4, deeply grooved adaxially, with an abaxial knot. A family of about 15 genera and 850 species distributed worldwide in the tropics, subtropics, and north-temperate zone. Many species are cultivated for edible fruit, particularly the wine grapes (cultivars of *Vitis labrusca*, Concord grape, especially *Vitis vinifera*, the wine grape), and some as landscape ornamentals. The family's systematic position is controversial at present. In the past, relationships have been suggested with the buckthorn family (Rhamnaceae) or various families in the Rosalean complex. Its origin and relationships remain enigmatic despite recent DNA studies.

1. Leaves palmately compound.....***Parthenocissus***
1′ Leaves simple, sometimes weakly palmately lobed .....***Vitis***

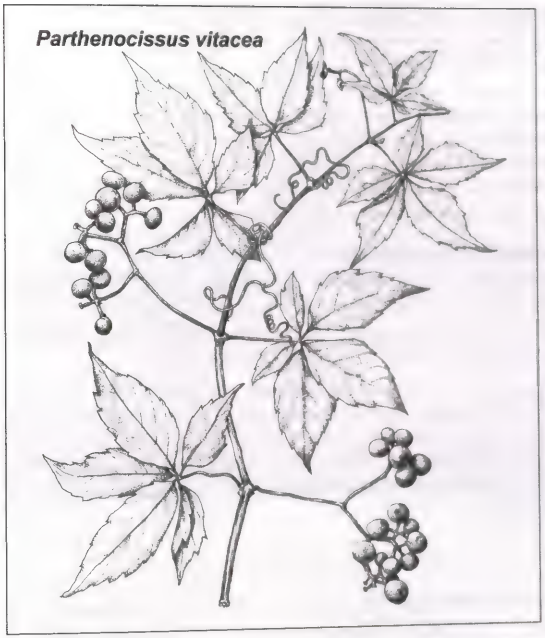
Parthenocissus Planch. Thicket Creeper, Creeper, Woodbine

(Greek *partheno*, virgin, + *cissus*, ivy) Climbing, sprawling, or creeping woody vines. **STEMS** freely branching, with smooth bark, resinous lenticels prominent; tendrils mostly bifurcate, with or without adhesive discs. **LEAVES** palmately compound, deciduous, leaflets 3–7, margins serrate. **INFL** of lateral or terminal cymose panicles, opposite the leaves. **FLOWERS** either unisexual or perfect but often functionally unisexual, 5-merous; calyx small, 5-tipped; petals separate above; stamens 5, reduced in female flowers; pistil vestigial in male flowers, style absent or short; nectary disc obsolete. **FRUIT** a somewhat dry to fleshy berry. **SEEDS** 4 or fewer by abortion. About 15 species, distributed in the temperate zone of North America and Asia.

1. Leaflets dull green above; inflorescence with a strongly zigzagging main axis; tendrils ending in adhesive discs .....***P. quinquefolia***
1′ Leaflets dark shiny green above; inflorescence dichotomously branching; tendrils lacking distinct adhesive discs .....***P. vitacea***

Parthenocissus quinquefolia (L.) Planch. (five-parted leaves) Virginia creeper. Clambering or sprawling to strongly climbing vine. **STEMS** pale tan to brown, mostly round, young bark glabrous, older bark becoming flaky, resinous lenticels common on older stems; tendrils strongly branched, with distinct adhesive discs. **LEAVES** dull green above, glabrous below, the central leaflet 4–14 cm long and 3–7 cm wide, lateral leaflets somewhat smaller, leaves turning red in autumn. **INFL** of terminal or axillary cymose clusters opposite leaves, with a strongly developed main axis that zigzags, divergent branches with small umbellate clusters of flowers. **FLOWERS** unisexual, small, inconspicuous, green. **FRUIT** blackish, somewhat fleshy, 4–8 mm wide [*P. inserta* (J. Kern.) Fritsch]. Introduced cultivated vine, often persisting or sometimes escaping in damp riparian areas and around buildings, native to eastern North America. ARIZ: Apa, Nav; COLO: Mon; NMEX: McK, SJn; UTAH. 1500–2200 m (5000–7200′). Flowering: May–Jun. Fruit: Jun–Jul. The name *P. inserta* has been applied to western plants, but it is a synonym of the eastern United States species *P. quinquefolia* (L.) Planch. This species is commonly grown as an ornamental in the West and can persist around old structures and abandoned farms.

Parthenocissus vitacea (Knerr) Hitchc. (affinity to *Vitis*) Thicket creeper, tc'ilna'at–'ó'ĩh, píla'astla'ĩh. Weakly climbing, clambering or sprawling vine. **STEMS** pale tan to brown, mostly round, young bark glabrous or rarely minutely whitish scabrous, older bark becoming flaky, resinous lenticels common on older stems; tendrils weakly branched, lacking adhesive discs although slightly swollen at tip. **LEAVES** shiny dark green above, glabrous to pubescent below, the central leaflet 4–15 cm long and 3–8 cm wide, lateral leaflets somewhat smaller, leaves turning red in autumn. **INFL** of terminal cymose clusters opposite leaves, dichotomously forked at the top of the peduncle with subsequent dichotomous forks with clusters of numerous flowers. **FLOWERS** unisexual, small, inconspicuous, green. **FRUIT** purple to



black, somewhat fleshy, 5–10 mm wide [*P. inserta* (J. Kern.) Fritsch, misapplied in some literature.] Native vine of springs, seeps, and wet, shaded riparian zones. ARIZ: Apa, Nav. COLO: Arc, LPl, Mon, SMg. NMEX: McK, RAr, SJn; UTAH. 1150–2400 m (3800–8000'). Flowering: May–Jun. Fruit: Jul. The native thicket creeper of the west, this species has been used by the Navajo as a ceremonial and medicinal plant, for food (the berries), and for thatching ramadas.

Vitis L. Grape

(classical Greek name for wine grape) Strongly climbing to sprawling, freely branching woody vines. **STEMS** with shredding or flaking bark, lenticels obscured or not prominent; tendrils mostly bifurcate, lacking adhesive discs. **LEAVES** simple, palmately veined, margins smooth to serrate, blades often palmately lobed. **INFL** of lateral cymose panicles opposite the leaves. **FLOWERS** functionally or structurally unisexual, 5-merous; calyx mostly obsolete, sometimes a connate ring present, petals separate below but coherent above; stamens 5, reduced in female flowers; pistil vestigial in male flowers; style absent or short; nectary disc usually well developed, at base of ovary, typically 5-lobed. **FRUIT** a juicy berry. **SEEDS** 4 or fewer by abortion. A genus of 60–70 species, primarily distributed in the temperate zone of the Northern Hemisphere. Most species of *Vitis* have been used for food and beverages, and the wine grape, *V. vinifera*, native to the Mediterranean and Middle East and one of the staples of western civilization, has been widely cultivated for wine production in virtually all suitable habitats worldwide. The species first appeared in cultivation sometime prior to 5000 B.C.E.

Vitis arizonica Engelm. **CP** (of Arizona) Arizona grape, tc'ilna'at–'ó'ĩh. Climbing or clambering woody vines. **STEMS** with shredding or flaking bark, freely branching, young twigs tomentose, becoming mostly glabrous with age; tendrils bifurcate, lacking adhesive discs. **LEAVES** long-petiolate, blades cordate-ovate, simple, palmately veined, cottony pubescent on both sides when young, hairs persisting on lower leaf veins although sometimes becoming glabrous with age, margins with sharp teeth, blades sometimes palmately lobed, large, 5–12 cm long. **INFL** a loose, open, strongly branched panicle, opposite the leaves. **FLOWERS** functionally or structurally unisexual, 5-merous, calyx obsolete, petals white, separate below but coherent above; stamens 5, reduced in female flowers, long-erect in male flowers; pistil vestigial in male flowers; style short, stigma discoid; nectary disc present, 5-lobed. **FRUIT** a juicy purple-blue to black berry, skin readily separated from pulp. Rare in southern parts of the region, around springs and seeps, and in dense, shaded, damp, riparian woodlands. ARIZ: Apa; NMEX: SJn. 1500–2100 m (5000–7000'). Flowering: May–Jun. Fruit: Jun. *Vitis arizonica* is highly variable in pubescence and leaf shape, with forms occurring that are nearly glabrous. These have been named var. *glabra* Munson. The berries are edible and are relished by both wildlife and humans. Apparently the combination *V. arizonica* was never validly published by Engelmann, according to Eric Wada (pers. comm. 2006), who is currently revising the western grapes. The wine grape, *V. vinifera*, is widely cultivated in the region and can persist after abandonment. This species differs from *V. arizonica* in that the bark is not very shreddy or flaky on mature stems, the flowers are bisexual, and the skin of the fruit cannot be separated easily from the pulp.

ZANNICHELLIACEAE Chevall. HORNED-PONDWEED FAMILY

C. Barre Hellquist

Annual, rarely perennial herbs; rhizomes present or absent; caulescent aquatic, submerged. **LEAVES** alternate, opposite, and pseudowhorled, often on the same plant, submersed, sessile, sheath not persisting; blade linear. **INFL** an axillary cyme, without subtending spathe, sessile. **FLOWERS** unisexual, staminate and pistillate flowers on same plant; subtending bracts and perianth absent; staminate flowers with 1 stamen; anthers dehiscing longitudinally; pistillate flowers with (1–) 4–5 (–8) pistils, distinct, short-stipitate; ovules pendulous. **FRUIT** drupaceous. **SEED** 1; embryo curved (Haynes and Holm-Nielsen 1987). Four genera. About 10–12 species worldwide.

Zannichellia L. Horned-pondweed

(for Gian Girolamo Zannichelli, 1662–1729, Venetian apothecary and botanist) Root single or paired at nodes. **LEAVES** 2–10 cm long, up to 2 mm wide with an entire blade, veins 1 (–3), nearly terete. **INFL** usually of 2 flowers, 1 staminate, 1 pistillate. **FLOWERS** short-pedicellate. **FRUIT** minutely dentate along convex margin; endocarp coarsely papillose; stipe developing into a stalk supporting the pistil (podogyne). Species about five worldwide.

Zannichellia palustris L. (of marshes) Horned-pondweed. Submersed herbs. **LEAVES** 3.5–4.2 cm × 0.2–1 mm, apex acute. **FLOWERS**: staminate with filaments 1.5–2 mm; pistillate with 4 or 5 pistils; style 0.4–0.7 mm. **FRUIT** 1.7–2.8 × 0.6–0.9 mm; rostrum 0.7–2 mm; podogyne 0.1–1.5 mm; pedicel 0.3–1.2 mm. Brackish and freshwater ponds, lakes, streams, and ditches. ARIZ: Apa, Nav; COLO: LPl; NMEX: SJn. 1475–2750 m (4925–9100'). Flowering: Jul–Aug. Fruit: Jul–Sep. Alaska east to Quebec and Newfoundland, south throughout the United States; Mexico; West Indies; Central America; South America; Eurasia; Africa; Australia.

ZYGOPHYLLACEAE R. Br. LIGNUM VITAE (CALTROP) FAMILY

Linda Mary Reeves

Primarily shrubs, herbs, and a few trees. **STEMS** sometimes jointed. **LEAVES** mostly fleshy or leathery; often pinnately compound; opposite, occasionally alternate; with stipules often becoming spiny. **INFL** solitary-flowered or paired. **FLOWERS** perfect; actinomorphic; sepals imbricate, 4–5; petals 4–5, distinct, imbricate; stamens in 1–3 whorls of 5, the outer series opposite the petals, filaments often scaled at the base; disc present; ovary superior, carpels 2–12, usually 5, fused, winged, locules 5; placentation axile. **FRUIT** a capsule, often splitting into 5 sections, occasionally a berry or drupelet. About 25 genera with about 240 species. Worldwide dry or seaside tropical, subtropical, and temperate zones. *Guaiacum officinale* is the source of the decongestant guaifenesin and, with *G. sanctum* and *Balansaea* sp., the source of valuable lignum vitae timber, the heaviest known wood. Some species provide a valuable oil used in perfumes. *Peganum harmala*, a noxious weed of Mediterranean origin, produces the dye Turkey red.

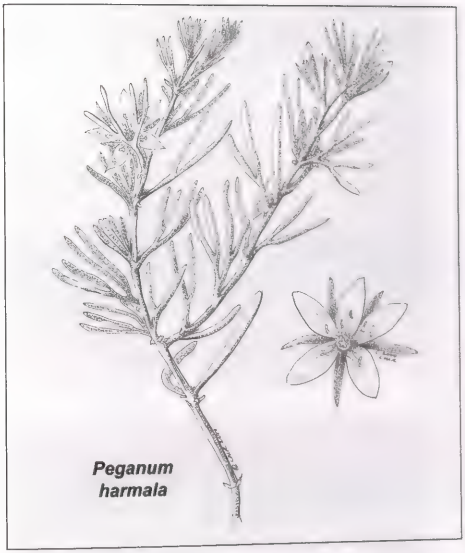
1. Leaves alternate; fruit a glabrous loculicidal capsule ..... ***Peganum***
1' Leaves opposite; fruit at maturity separating into 5 or 10 indehiscent mericarps ..... (2)

2. Mericarps 10, tubercled, 1-seeded, with persistent beak ..... ***Kallstroemia***
2' Mericarps 5, spiny, 3–5-seeded; fruit beak deciduous ..... ***Tribulus***

Kallstroemia Scop. Desert Poppy, Caltrop

Prostrate to ascending, diffusely branching, annual or perennial herbs. **STEMS** pubescent to glaucous or glabrous. **LEAVES** opposite; even-pinnate; leaflets obovate to elliptic; 3–8 pairs, 1 of each pair sometimes alternately smaller or abortive or often obtuse. **FLOWERS** solitary, axillary from smaller leaves; sepals 5, pubescent, imbricate, usually persistent; petals 5, orange to yellow, cream, or white, apex rounded or notched; stamens 10, in 2 whorls of 5 each, outer whorl slightly longer than inner whorl; style persistent, ovary globose to ovoid, 10-loculed, pubescent to glabrous; ovules 1 per locule. **FRUIT** at maturity separating into 10 indehiscent, 1-seeded mericarps. About 17 species of New World subtropical and tropical areas, in disturbed or alluvial soils.

Kallstroemia parviflora Norton (small-flowered) Caltrop. Prostrate to decumbent annual. **STEMS** hirsute, sericeous to glabrous, to 1 m long. **LEAVES** 1–6 cm long; leaflets 3–5 pairs; elliptic to oval, hirsute, 8–19 mm long, 3.5–9 mm wide. **FLOWER** pedicels longer than subtending leaves; sepals lanceolate, 4–7 mm long, 1–2 mm wide; petals orange, narrowly obovate to oval, 5–11 mm long, 3.5–6 mm wide. **FRUIT** ovoid, strigose, 3–4 mm long, 4–6 mm wide; beak persistent, longer than fruit body; mericarps rugose to tubercled, 3–4 mm high, about 1 mm wide. [*K. intermedia* Rydb.].

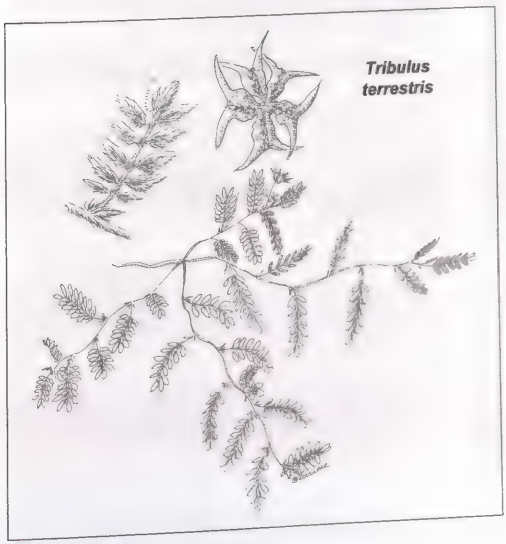


Primarily alluvial soils and disturbed sites. ARIZ: Nav; NMEX: SJn. 1400–2000 m (4600–6500'). Flowering Jul–Oct. Fruit: Aug–Nov. Central and northern to western Texas through New Mexico, Colorado, Arizona, southern Nevada to southern California, north through Oklahoma to Illinois, and south from Sonora, Chihuahua, Coahuila, Nuevo León to Durango, Aguascalientes, and San Luis Potosí.

Peganum L. African Rue, Garbancillo

Dichotomously branched, prostrate to ascending, often globose herbs, height less than 1.5 m. **STEMS** herbaceous, pubescent to glabrous, arising from a perennial rootstock. **LEAVES** congested, alternate, fleshy, irregularly pinnatifid; lobes linear, acute to apiculate; pubescent to glabrous; stipules hairlike. **FLOWERS** solitary; sepals 4–5, irregularly pinnatifid to entire, segments linear, acute, valvate in bud, persistent; petals 4–5, white or cream to yellow, subequal, imbricate in bud; stamens 12–15; filaments with bases dilated; ovary globose, 2–4-loculed. **FRUIT** an irregularly dehiscent capsule with beak as long as or longer than fruit body. **SEEDS** triangular, dark, curved, numerous. A genus of three species, one from the Chihuahuan Desert of North America, the other two from the arid regions of the Mediterranean and Asia.

Peganum harmala L. (possibly named after Harmala, a city in Syria; also an old plant name in Arabia) African rue. **STEMS** prostrate to ascending-globose, pubescent to glabrous, to 90 cm long and 30 cm high. **LEAVES** glabrous to slightly pubescent. **FLOWERS** with pedicels twice as long as petals; sepals longer than petals; petals white to yellow, oblong-elliptic, to 15 mm long; filaments dilated basally; disc cupulate. **FRUIT** a capsule, peduncles longer than fruit, to 15 mm in diameter. Known from one disturbed site near Aztec, New Mexico. NMEX: SJn. 2000 m (6000'). Flowering Apr–Nov. Fruit: May–Nov. An introduced weed from Asian deserts. Originally introduced in Luna County, New Mexico, in the 1930s and extending its range. Known from Nevada, Arizona, southern New Mexico, and western Texas.



Tribulus L. Goathead, Caltrop

(three-pointed, referring to the mericarp) Prostrate or ascending-spreading annual or perennial herbs from a central taproot, to 3 m long. **STEMS** diffusely branched, appressed, sericeous-hirsute. **LEAVES** opposite; even-pinnate; 1 of each pair alternately smaller or abortive; leaflets 3–7 pairs, oblong to ovate, tending toward falcate. **FLOWERS** solitary, pedicels emerging from smaller leaf axils; sepals 5, pubescent, deciduous; petals 5, bright to light yellow, occasionally white; obovate, apex generally rounded; stamens 10, in 2 whorls of 5 each, outer whorl adnate to petals, with glands; ovary with 5 locules, hirsute; ovules 15–25. **FRUIT** of 5 indehiscent mericarps, each with 2–4 dorsal spines and smaller spines and/or tubercles; beak deciduous. A desert genus of the Old World with about 70 species, 3 of which are introduced in North America.

Tribulus terrestris L. (of the land) Goathead, caltrop, puncture weed, puncture vine, arrojo de flor amarilla, cadillo. Prostrate annual. **LEAVES** 10–45

mm long, leaflets 3–6 pairs, oblong to ovate, 4–10 mm long, 1–5 mm wide. **FLOWERS** 5–10 mm diameter; sepals 2–3 mm long, ovate; petals 3–5 mm long; intrastaminal glands free. **FRUIT** to about 2.5 cm wide, including spines, largest spines about 3–7 mm long; separating into 5 crested segments. Typical inhabitant of disturbed soils, especially sandy and gravelly substrates near agricultural areas, homes, and roadsides. $2n = 12, 24, 36, 48$. ARIZ: Apa, Coc, Nav; COLO: Arc, Dol, LPl, Mon; NMEX: McK, RAr, San, SJn; UTAH. 1400–2100 m (4600–7000'). Flowering: Apr–Sep. Fruit: May–Nov. Introduced from Asian deserts. A scourge of dry, sandy habitats, backyards, and gardens that destroys bicycle tires and scars animal paws as well as the feet of those foolish enough to walk without shoes. Unfortunately, seeds have been known to be viable for up to eight years.

Abaxial The side away from the axis, usually the underside.

Abcission zone The layer of cells, often in a leaf petiole, that becomes corky and dry under certain circumstances, such as a change in hormones, and allows the leaf or other structure to become deciduous.

Abortive Failing to mature, undeveloped.

Acaulescent Without an obvious stem; plants with basal leaves only are considered acaulescent.

Accessory Fruit derived from parts other than the ovary, often the receptacle, as in *Fragaria*. Most of the fruit, especially the exocarp, may include some accessory-derived structures.

Accrescent A structure that becomes larger with age, such as a calyx in some flowers.

Acequia An irrigation canal ("ditch") originally constructed or planned by Spanish settlers in New Mexico, but later applying to all managed farm irrigation ditches.

Acerose Needle-shaped, as in the leaves of conifers.

Achene (akene) Small, dry, one-seeded, indehiscent fruit developing from a superior ovary, as in *Carex*. The ovary wall is usually thin (pericarp) and not fused to the seed layers (the seed is loose).

Achenial Of the achene.

Achlorophyllous Without chlorophyll, as in nongreen parasitic plants.

Acicula (aciculus) A small needle-shaped structure or the end of a sharp prickle, thorn, or spine.

Acicular Needle-shaped.

Acropetal Closer to the tip than the base.

Acroscopic Facing or on the side toward the apex.

Actinomorphic (regular) Flowers with whorls of parts radially symmetrical, all parts in each whorl alike, typically based on petals unless otherwise stated.

Aculeate Sharply pointed; beset with prickles or spines.

Acuminate Gradually tapering to a point with slightly concave margins.

Acute Forming an angle of less than 90°.

Adaxial The side toward the axis, usually the upper side.

Adhesive disc Disc of plant tissue growing from the stem of some vines and lianas that attaches to the substrate.

Adnate Union or fusion of two or more unlike parts, as stamens adnate to petals.

Adventive Not native; introduced and populations increasing.

Aerenchyma A type of parenchyma, usually chlorenchyma, which contains many air spaces, such as in *Nymphaea*.

Aerial Borne above ground level, usually stems.

Agamospermous Able to form a seed without fertilization.

Aggregate Fruit formed from a cluster of pistils that were distinct in a single flower, as in *Fragaria*.

Alcove Shallow cave-like depression in a cliff wall, usually in sandstone, and which often has seeps in the rear.

Allopatric Occupying different geographic locations.

Allopolyploidy The condition of having complete chromosome sets from two or more different species.

Allotetraploid An allopolyploid with four chromosome sets, or 4*n*.

Alluvial Composed of alluvium substrate, such as mud, sand, gravel, or cobble deposited by water.

Alluvium Soil substrate that has been moved into place by moving water.

Alpine Above tree line, generally 3500 m (11500') in our area, depending upon exposure and other factors.

Alpine tundra The treeless plant community of matted, tufted, and prostrate plants found above timberline.

Alternate Having one leaf at a node, with successive leaves on opposite sides of the stem.

Alveolate As a honeycomb, with depressions separated by thin partitions or ridges.

Ament (see **catkin**) A dense inflorescence of unisexual flowers.

Amphibious Plants that live both in water and on land, often shore dwellers.

Amphimictic Able to interbreed freely, producing fertile offspring.

Amphitropic Usually an ovule that is half inverted and straight, with a lateral hilum.

Amplexicaul Referring to leaf bases that clasp the stem.

Ampliate Enlarged or expanded.

Anastomose Netlike, as in many leaf veins.

Anatropous An ovule that is inverted, with the micropyle opening axis parallel to the funiculus.

Androgynous Staminate flowers borne above pistillate flowers.

Andromonoecious Having staminate and perfect flowers on the same plant.

Angled With a sharp corner or corners.

Angustiseptate A fruit that is flattened at right angles to the septum, as in some Brassicaceae.

Annual Plants that grow from seed, flower, produce seed, and die in the same year, sometimes within a few weeks.

Annulus A ring-shaped structure; a row of specialized, thick-walled cells along one side of a fern sporangium that aids in spore dispersal by contraction.

Anther The portion of the stamen that produces and bears pollen.

Anthesis The time when a flower is fully mature.

Anthocyanic With a reddish or purplish tinge due to pigments called anthocyanins.

Antisepalous Located opposite the sepals.

Ant lion The larva of a neuropteran insect that builds a conical trap in sand to catch ants as prey.

Antrorse Forward or upward in direction.

Aperturate With an opening, typically referring to the openings in pollen grains.

Apetalous Without petals.

Apex Tip of the leaf blade or other structure.

Apical At the apex or tip.

Apiculate With a short, flexible tip.

Apiculum (see **apiculus**).

Apiculus A small, sharp point.

Apogamous Relating to an embryo produced without fertilization.

Apomictic (see **apomixis**).

Apomixis Seed production without fertilization (agamospermy).

Apophysis (apophyses) A projection on a structure; the portion of a cone scale exposed when the cone is still closed.

Appendage A petal-like extension of the gland in many species, as in *Chamaesyce* and *Euphorbia*; may be obsolete to conspicuously petaloid; if present, usually white or less often pink or even reddish, usually entire, sometimes crenulate or divided, rarely fimbriate or pubescent.

Appressed Lying flat and close against the ground or another part.

Aquatic Growing in water, either emergent, submerged, or floating.

Arachnoid With cobwebby, tangled hairs.

Arachnose (see **arachnoid**).

Archegonium The structure in plants that produces and contains the female gamete; a vase-shaped structure in bryophytes, ferns, and fern allies that produces and contains the egg on the gametophyte.

Arcto-Tertiary Geoflora The ancient temperate flora in place in much of North America at the beginning of the Tertiary. This flora included many gymnosperm and angiosperm trees and shrubs.

Arcuate Curved into an arch; bowed.

Arenophilous Sand-loving.

Areole The node of a cactus plant that bears spines, flowers, or both (rarely leaves) and may produce new stems.

Aril A structure (usually fleshy) growing at or in the vicinity of the hilum of a seed, may be substantial and provide food for a distributing organism.

Arillate With an aril.

Arista A bristle.

Aristate With an elongate, bristlelike tip.

Armature Thorns, spines, prickles, or sharp trichomes, barbs.

Ascendant (see **ascending**).

Ascending Growing upright, often in a curving fashion.

Assurgent (see **ascending**).

Atomiferous Bearing sessile or subsessile glands.

Attenuate Gradually narrowed and tapering to a point.

Auct. nonn. Of some authors.

Auricle A small, ear-shaped appendage.

Auriculate Having an auricle.

Autogamy Self-fertilization.

Autonym When an author names a new subspecies or variety, it is given the new rank based on the original species type and duplicating the specific epithet; i.e., *Platanthera dilatata* var. *dilatata*.

Autopollination Self-pollination.

Autopolyploidy The condition where an organism has two or more complete chromosome sets derived from the same species.

Awn A bristlelike appendage.

Axial (see **axile**).

Axil The upper angle between a stem and a leaf or another stem.

Axile Located in the axis, such as axile placentation.

Axis The central line or stem along which plant parts are organized or arranged; the imaginary central line in an organ or structure.

Baccate Berrylike; soft.

Backcross A genetic cross in which offspring are crossed with parents or other ancestors.

Ballistic dispersal Dispersal of seeds or other propagules, usually under pressure, which scatters the materials a distance from their origin.

Barbed Bearing sharp, rigid, reflexed points like those on a fishhook.

Barbellate Bearing short, stiff hairs.

Barbellulate With very minute, stiff hairs or barbs.

Basal Related to or located at the base, usually of the leaf or petal.

Basifixed Hairs or scales fixed at the base.

Basionym The first name published for a taxon.

Basipetal Closer to the base rather than the tip; produced sequentially from the apex toward the base.

Basiscopic Facing or on the side toward the base.

Beak A prolonged, usually narrowed tip of a thicker organ, as in some fruits and petals.

Bermuda High A high-pressure subtropical atmospheric air mass.

Berry Fleshy, indehiscent, many-seeded fruit with no true stone (pit) or core, embedded in pulp (includes pepo and hesperidium).

Bicarinate Two-keeled.

Bicolored Of two distinct colors.

Bicornute Two-horned.

Biennial Plants that live two years, usually flowering and fruiting the second year. The first year is typically represented by a rosette of leaves.

Bifid Split into two parts or lobes, as in some styles.

Bifurcate Forked; divided into two branches.

Bilabiate With two lips, as in many zygomorphic flowers.

Bipinnate Pinnately compound with each segment also divided pinnately; twice compound in a featherlike fashion.

Bipinnatifid Cleft or deeply lobed bipinnately.

Biserrate Doubly serrate; the individual teeth are also serrate.

Bisexual (see **perfect**).

Bladder A thin-walled, inflated structure.

Blade The expanded portion of a leaf or petal.

Bolt To produce flowers quickly or prematurely, often due to excessive heat or low water availability.

Bony Hard, stonelike.

Bract A leaflike structure usually associated with inflorescences.

Bracteole An especially small bract, especially subtending a flower.

Bractlet A small bract.

Branched Divide into two or more branches from a common stalk.

Breccia A sedimentary rock composed of angular fragments that have undergone lithification.

Bristle A hairlike structure, often representing an extremely reduced leaf, sepal, or petal.

Bud An undeveloped leaf or flower shoot typically enclosed by bud scales.

Bud scale Specialized leaves (bracts) that enclose a bud.

Bulb An underground bud with flat discoid stem, roots, and thickened storage leaves (as in an onion).

Bulbil An aerial bulb or reproductive stem.

Bulblets Small to tiny bulbs.

Bulbous Bulblike or pertaining to bulbs; rounded.

Bunchgrass Grasses that grow in caespitose tufts, usually without stolons or long rhizomes.

Bur-like (**burlike**) Spiny or prickly and often rounded.

Caducous Early-deciduous compared to similar structures in other plants.

Caespitose Growth in tufts or dense clumps from a common point.

Calcareous Containing deposits of calcium salts, often calcium carbonate.

Caldera A large depression in the summit or summit region of a volcano caused by collapse or ejection of volcanic materials.

Callous Hardened or thickened.

Callus (plural **calli**) A hard thickening or protuberance; the basal extension of the lemma in grasses.

Calyculus (**calycule** or **calycle**) Small bracts surrounding the calyx, appearing as a second calyx whorl.

Calyx (plural **calyces**) Outermost whorl of flower parts; collectively, all the sepals.

Campanulate Bell-shaped.

Canescent With an overall grayish aspect due to hairs.

Capillary Hairlike, very fine, slender.

Capitate Head-shaped or in a head inflorescence.

Capitulescence A grouping of heads into an inflorescence.

Capitulum A head, a dense inflorescence of small, sessile flowers, as in the Asteraceae.

Capsule Dry, dehiscent fruit of more than one carpel and opening on more than one line of dehiscence.

Carcinogenic A chemical, material, or organism capable of causing cell transformation and/or cancer.

Carinal Pertaining to a ridge or series of ridges.

Carinate (see **keel**).

Carpel A simple pistil, consisting of a single ovary, style, and stigma and having marginal placentation. The basic unit of the gynoecium; compound pistils are formed from the fusion of two or more carpels.

Carpophore A thin extension of the receptacle forming a central axis between the carpels, as in the Apiaceae and Geraniaceae.

Carpopodium (see **gynophore**) A stipe supporting an ovary.

Carr A meadowlike wetland, often with willows.

Cartilaginous Tough and firm like cartilage.

Caruncle A protuberance or appendage near the hilum of a seed, often conspicuous in subgenus *Esula* (Euphorbiaceae) and in *Croton texensis* (also many other *Croton* species). The caruncle often provides food for other organisms and aids dispersal of seeds, often by ants.

Caryopsis (**grain**) A dry fruit typical of the Poaceae, usually with the ovary wall fused to the seed layers.

Castaneous Dark reddish brown; chestnutlike in color.

Cataphyll Bract present in catkins and subtending the flowers.

Cathartic A substance or chemical causing vomiting and/or diarrhea.

Catkin Spikelike, commonly pendulous inflorescence of unisexual flowers.

Caudate Bearing a tail or tail-like appendage.

Caudex (plural **caudices**) The woody and often enlarged base of a perennial.

Caudicle Small stalk connecting the pollinium to the stipe in the pollinarium or directly to the viscidium in hemipollinaria of orchids.

Caulescent With an obvious stem.

Cauline On the stem.

Central spine One of the innermost spines of an areole.

Cernuous Nodding or drooping, as in some flowers.

Chaff Thin, dry scales or bracts, as on the receptacles of flowers in the Asteraceae.

Chaffy Having or possessing chaff.

Chalaza (**chalazal**) In the ovary, where integuments are connected to the nucellus at the opposite end of the seed's (or ovule's) micropyle.

Chalazal collar In the Onagraceae, a ridge or flap surrounding the chalaza (as opposed to a micropylar collar).

Chalazal knot A bump or protuberance on one side of the seed, as in some Vitaceae.

Channeled Possessing one or more deep longitudinal grooves over the length of the structure, such as a seed.

Chaparral From the Spanish word "chaparro," which means scrub oak; a semiarid vegetation type characterized by thickets of often spiny shrubs.

Chartaceous With a stiff, papery texture.

Chasmogamous Flowers that open before fertilization and are generally cross-pollinated.

Chinle Formation A reddish, yellowish, or grayish clay-containing formation of sandstones or siltstones of Triassic age. This formation contains numerous endemics.

Ciliate With marginal hairs or scales; thinly and finely fringed.

Ciliolate With short marginal hairs or scales; thinly and finely fringed.

Cinereous Ash-colored; grayish due to a covering of short hairs.

Circinate vernation When new fern fronds emerge rolled or coiled.

Circular (orbicular, round) Flat and round in outline.

Circumboreal Distribution circling around the earth's northern pole.

Circumpolar Distribution circling around one of the earth's poles, usually in boreal and/or north-temperate regions.

Circumscissile A fruit, sporangium, or anther that opens by dehiscence around the top, forming a lidlike structure.

Cirque An amphitheater-shaped structure at the head of a glaciated valley.

Clade A monophyletic lineage.

Cladode (cladophyll) A stem with the morphology and photosynthesis function of a leaf.

Clambering Growing in a vining manner on the substrate.

Clasping Grasping or partially surrounding, but attached on one side; usually a leaf grasping a stem, often with basal lobes.

Clavate Club-shaped; widening toward the apex.

Claw A narrow petal base, often petiole-like.

Clay barren Alkaline and clay soils, usually of Morrison, Mancos, Chinle, and Fruitland formations, often with bentonite clays that shrink and swell according to the amount of water absorbed or lost. Swelling may be seven times the original volume due to water absorption. This is an area with low vegetation diversity, but those plants that are able to survive may be specifically adapted and endemic to clay soils.

Clearcut Places where all trees or shrubs have been cut or logged.

Cleft Incompletely divided or split nearly to the middle.

Cleistogamous Flowers that do not open and generally self-fertilize.

Club-cholla Cholla cacti with jointed, club-shaped stems; the genus *Corynopuntia* in our area.

Coalescent Grown together to form a unit.

Cobwebby Arachnoid; referring to hairs, such as in some Polemoniaceae or Asteraceae; a type of phylogeny in which species are interrelated or sometimes indistinct.

Coetaneous Flowers developing at approximately the same time as leaves.

Coiled cyme A determinate, coiled inflorescence.

Colluvium (hillwash) A heterogeneous mixture of rock and soil material that has moved down a slope or cliff by gravitational action and collected at the base of a cliff; such as avalanches, mudslides, rockslides, etc.

Columella An axis to which a carpel of a compound pistil may be attached, which may remain in the open dry fruit.

Column The united filament(s) and style of the Orchidaceae; the union of staminal filaments, as in the Malvaceae.

Columnar More or less vertical; pertaining to the column.

Coma A tuft of hairs, usually on the tip of a fruit or seed, as in the Asteraceae; the head of a tree.

Commissure The face by which two carpels join one another, as in the Apiaceae.

Comose With a coma or comalike.

Compound Leaves composed of separate leaflike parts called leaflets.

Concave Forming an inward-curving space on a structure, such as a seed or floral part.

Concavo-convex Concave on one side and convex on the other.

Concolored All parts of uniform color; grayish brown in color.

Conduplicate Folded together lengthwise, as in many grasses.

Cone A usually woody strobilus in nonflowering plants; a dense cluster of sporophylls on an axis; any structure with a conelike form.

Cone scale The woody, leaflike structure on a conifer cone that holds seeds or pollen.

Confluent The blending of one part into another.

Congested With the units grouped closely together, as in a congested inflorescence.

Conifer savanna A parklike vegetation association where, in our area, conifers, often junipers or piñon pines, are interspersed among grassland species.

Connate Union of like adjacent structures.

Connivent Converging, stuck together but not fused or united.

Conniving Becoming connivent.

Consimilar Similar to one another.

Convergent Meeting together.

Convex Bulging out, as in seeds or floral structures.

Convolute Parts overlapping like roof shingles; rolled up longitudinally.

Coralloid Coral-shaped, such as the underground roots of *Corallorhiza* or cycads

Cordate Heart-shaped, with base rounded and prominently notched, sides tapering to a narrowed apex

Coriaceous Leathery in texture.

Cork Dead-celled outer layer of bark tissue produced by cork cambium in woody plants, a layer of bark infused with waxy suberin.

Corky Possessing cork tissue; unusually thick layer of tissue.

Corm A short, sometimes disclike, vertical underground stem covered with small, thin, papery leaves

Cormose Cormlike.

Corolla Second from outside whorl of flower parts; the collective name for the petals.

Corona Petal-like crown structure such as in some *Asclepias* or *Nasturtium* flowers

Corona scale Papillose scales forming the corona in the Boraginaceae; scales forming a circle around the eye in the Onagraceae.

Coroniform Crown-shaped.

Corpusculum A gland associated with the pollinarium in the Asclepiadaceae

Cortex A layer of storage parenchyma tissue interior to the epidermis and exterior to the phloem in roots and stems, part of the bark in woody plants.

Corymb Nearly flat-topped, indeterminate inflorescence; lower and outer pedicels longest; simple or compound

Corymbiform An inflorescence with the general appearance of a corymb, but not necessarily the form

Costa (plural **costae**) A rib or prominent midvein.

Costellate With many small ribs.

Cotyledon A seed leaf of the plant embryo, often containing nutrients for the growth of the young plant

Cowl A gently folded-over structure, often forming a rim.

Crassulacean Acid Metabolism (CAM) A type of carbon fixation in many succulent plants which fixes carbon dioxide at night into organic acids, allowing stomata to remain closed during the hot day

Crateriform Shallowly cup-shaped.

Creeping With prostrate growth, often producing roots at nodes.

Crenate With broad, rounded teeth; scalloped.

Crested Cristate or with a tuft or projection.

Cretaceous Geological period from 135 to 65 million years ago; several geologic formations from this time period are found throughout the Four Corners region.

Crisped Curled, wavy, or crinkled.

Cristate (see **crested**).

Cross section A section obtained by cutting across a long axis.

Crown The perennial stem base of a herbaceous plant. Also, the leafy top of a tree.

Crown scale A type of scale found on the corona of gentians; a small scale opposite the nectaries, often attached at the base of the filament, in *Frasera* at the base of the ovary.

Crozier A young, curled fern frond.

Cruciform In the form of a cross, as in species of *Marsilea* or flowers of the Brassicaceae (Cruciferae)

Cucullate Hooded or hood-shaped.

Cuesta An asymmetrical ridge with a steep slope on one side and a gentle slope on the other. The gentle slope is at a lower angle than that of hogbacks.

Culm A stem, often hollow or pithy, especially in the Poaceae or Cyperaceae.

Cultivar A variety that has been artificially selected and grown horticulturally.

Cuneate Wedge-shaped or triangular, with the point of attachment at the narrowest part.

Cupular With a small cup or cuplike structure.

Cupulate Cup-shaped; with a small cup-shaped structure.

Cuspidate Tipped with a short, sharp, abrupt point.

Cyanobacteria Photosynthetic prokaryotes responsible for much of the nitrogen fixation in an ecosystem and which often affect calcium carbonate deposition in an aquatic environment and can be symbionts with certain plants, as in the Myristicaceae or Orchidaceae; "blue-green algae."

Cyathial lobes Five (or appearing more) short, variably shaped and/or variably margined extensions of the cyathial rim that are the tips of the fused floral bracts; the glands and lobes typically alternate along the rim in the Euphorbiaceae.

Cyathium A greatly reduced, highly modified inflorescence of the Euphorbiaceae that is composed primarily of an involucre of fused bracts (that is more or less cup-shaped) containing separate male and female flowers and on its margins glands and sometimes petaloid appendages, all of which in aggregate resemble a single small flower; each cyathium encloses few to many staminate flowers (each consisting of a single stamen) and one pistillate flower; one to five glands, often bearing appendages, typically alternate with the cyathial lobes (the distal vestiges of the floral bracts); the cyathium may have hairs externally and/or internally.

Cylindric (cylindrical) Elongate and round in cross section.

Cylindroid Tending toward cylindrical.

Cyme Determinate inflorescence with central flowers opening first.

Cypsela (plural **cypselae**) Small, dry, one-seeded, indehiscent fruit developing from an inferior ovary, as in the Asteraceae. The ovary wall is usually thin (pericarp) and not fused to the seed layers (the seed is loose).

Dakota Sandstone A type of sandstone, sometimes arkosic, composed of sand grains and a matrix.

Deciduous Plant parts that are shed or fall off either seasonally or after a certain stage of development.

Declined Curved downward.

Decoction An extract, usually of plants, made by gently boiling the materials in water. The strained liquor is usually the decoction.

Decompound More than once compound; the leaflets subdivided.

Decumbent Flat or resting on the ground, but with growth tips ascending.

Decurrent Extending downward to the point of insertion.

Decussate Opposite pairs, usually leaves, that alternate perpendicular to the previous and following pair.

Deflexed Turned abruptly downward.

Dehiscing Opening at maturity, of such structures as dry fruits and anthers.

Deltate (see **deltoid**).

Deltoid Equilaterally triangular.

Dentate With pointed teeth facing outward.

Denticle A small tooth or toothlike projection.

Denticulate Minutely dentate or toothed.

Depauperate A specimen that is poorly developed or a plant community with poor expression of characters or diversity.

Depressed Low and/or flattened from above perspective.

Descending Pointing downward at an angle.

Determinate An inflorescence where the terminal (most distal) flower opens first, generally the inflorescence produces a finite number of buds.

Detrital Consisting of decayed and/or partially decomposed materials.

Diad A group of two structures, free from others.

Diatreme A volcanic feature formed by gas or volatile magma, usually in the lower crust or upper mantle.

Dichasial (see **dichasium**).

Dichasium A cymose inflorescence in which each axis produces two opposite axes, equally dividing in structure.

Dichotomous Forked in equal branching pairs.

Dicot (dicotyledon) A paraphyletic group of angiosperms that possess two cotyledons (food storage leaves) in the seed and young seedling.

Didymous Found in pairs.

Didynamous With two pairs of stamens of unequal length.

Diffuse Finely and widely spread out, as in a diffuse inflorescence.

Dilated Broadened, but remaining flat.

Dimorphic Existing in two forms or sizes.

Diné Literally, "the people," referring to people of the Navajo tribe.

Dioecious (see **imperfect**) With staminate and pistillate flowers on different plants.

Dioecy Being dioecious; with male and female flowers or cones on separate plants, common in tropical trees and some gymnosperms.

Diorite A type of volcanic rock that cools rapidly and has large crystals.

Disarticulating Coming apart, as some parts of Poaceae inflorescences.

Disc A fleshy structure surrounding the base of the ovary; the tubular flowers of the Asteraceae.

Disc floret A regular, usually tubular flower in a head of the Asteraceae.

Disciform In the form of a disc.

Discoid Resembling a disc; with disc flowers, as in the inflorescence of a member of the Asteraceae that lacks ray flowers.

Disjunct species A species that occurs as a population, often in a novel or atypical habitat, strongly isolated from the remainder of the species range. Disjuncts result either from persistence (i.e., they are relictual) or from recent long-distance dispersal.

Dissected Leaf surface deeply cut into numerous fine divisions.

Distal Toward the end of the organ opposite attachment.

Distinct Not united with adjacent similar parts; separate.

Dithecal Usually referring to anthers, where there are only two anther cells.

Diuretic Promoting the excretion of urine.

Diurnal Active or open during daylight hours.

Divaricate Widely diverging or spreading, as in some stigmas.

Dolabriform (see **malpighian**).

Drainage The area of land that a river or other body of water drains; a watershed.

Drupaceous Drupelike; bearing drupes.

Drupe Stone fruit; usually fleshy and indehiscent, with a stony endocarp and one seed, as in *Prunus*.

Drupelet A small drupelike fruit, often in a head or aggregate fruit.

Echinate With stout, sometimes blunt, prickles or spines.

Eciliate Without cilia.

Ecotype Populations adapted to a particular set of environmental conditions.

Ectomycorrhizae Mutualistic fungi that surround a plant's root and/or cells (but do not enter them) and provide nutrition from other plants or decaying soil materials. Often forms a covering of hyphae on the root called a Hartig net.

Edaphic Pertaining to the soil or substrate.

Efarinose Not covered with mealy particles, or losing these particles if they were present at one time.

Eglandular Without glands.

Elaiosome (**elaisome**) A gland that secretes an oil, volatile material, fragrance, or nutrient reward that rewards or attracts ants.

Elaminate Without a leaf blade; without the expanded portion of a sepal or petal.

Elator Structures attached to spores that aid in their dispersal; such as elongated flaps attached to *Equisetum* spores.

Eligulate Without a ligule, as in some Asteraceae.

Ellipsoid Three-dimensionally elliptic.

Elliptic Longer than broad, tapering equally at both ends; widest in the middle.

Emarginate Deeply and broadly notched.

Embedded A structure that is located entirely within another.

Emergent (see **emersed**).

Emersed Rising from, or standing out of water.

Emetic A substance or chemical that causes vomiting.

Encinal Small, shrubby oaks, from the Spanish "encino," referring to a chaparral scrub oak.

Endemic Found only in a specific geographic area or ecological situation.

Endocarp Inner layer of a fruit pericarp, sometimes stony, as in some *Prunus* species.

Endomycorrhizae Mycorrhizal fungi that enter spaces between cells in plant roots.

Endosperm A typically $3n$ or $5n$ nutritious food storage tissue surrounding an embryo in a seed; the result of the fertilization of polar nuclei by a sperm cell in the embryo sac.

Entire Smooth, not toothed, indented, or lobed.

Epaleate Without chaffy scales or bracts, as in some genera of the Asteraceae; without paleae, as in some grasses.

Epetiolate Sessile; without a petiole.

Ephemeral Not long-lasting, usually referring to pools or streams; annual plants that germinate and flower whenever sufficient moisture is present in any season.

Epidermis The layer of cells that forms the outermost protective tissue on a plant.

Epigynous Attached at the top of the ovary; when the ovary is completely inferior.

Epiparasitic Plants that obtain all or most of their carbon from other plants via mycorrhizal fungi.

Epipetalous On top of or attached to the petals.

Epiphyte A plant that grows on another plant for support but is not a parasite.

Eradiate Not radiating.

Erect Upright growth or position.

Erose (see **lacerate**) Irregularly indented; appearing gnawed or torn.

Erosulate More or less erose.

Estipulate Without stipules.

Estrophiolate Without a strophiole or rim-aril (seed appendage developing from the distal end of the funiculus), as in some seeds of the Fabaceae or Portulacaceae. Often contains oil droplets.

Ethologically Investigating an organism or process in a behavioral fashion.

Evanescent Remaining only a very short time.

Evaporite A sedimentary rock formed of material deposited from solution by evaporation of water.

Evapotranspiration The combination of water loss from both evaporation and plant transpiration.

Excluded Outside a structure or surface.

Excurrent Sticking out from the main structure.

Exfoliate Peeling off in flakes or plates, as in the bark of some trees.

Exine The outer hard layer, often with various sculpting, on a pollen grain or spore.

Exocarp The outer layer or skin of a fruit pericarp.

Explanate Flat; spreading.

Explosively dehiscent Opening all at once, usually expelling the contents quickly and scattering them a good distance, as in some fruits; the outer wall is usually obviously valvate.

Exserted Protruding, not included within the main structure.

Exstipulate Without stipules.

Extirpated Eliminated from an environment or extinct.

Extrusive A rock type that cooled at or near the surface; basalt.

Eye Generally a ring of differing color around the entrance to the corolla tube, as in some Primulaceae.

f. Author associates, such as children or siblings of a well-known authority.

Facultatively Able to live under varying conditions.

Falcate Sickle-shaped.

False indusium A structure covering the sori or a sorus in ferns that is derived from the inrolling of the frond margin.

False raceme Appearing as a raceme, but not a true raceme.

False septa Partially divided, the septa not completely meeting.

Farina A mealy yellowish, orange, or whitish material often on leaf or frond undersides.

Farinose Covered with meal-like particles.

Fascicle A tight bundle of leaves, stems, flowers, fruits, or roots, sometimes surrounded by a containing structure, as in some *Pinus* species.

Fell-field An alpine or subalpine soil of loose rock and gravel with less than 50% vegetation cover.

Female cone Typically a woody cone of gymnosperms, which produces seeds.

Fen A calcareous, marshy wetland.

Ferruginous Rust-colored.

Filament A threadlike structure; the stalk of an anther.

Filiform Threadlike.

Fimbria (fimbriae) A fringelike structure or projection, such as from a leaf or petal.

Fimbriate Fringed; thicker and less delicate than ciliate.

Fistulose Hollow and cylindrical.

Flabellate Fan-shaped.

Flaccid Limp; not turgid.

Flag With a short, slender extension, usually at the apex or top, as in some stamens; an ecological growth form of response to high winds, usually at high elevations, where the crown of a tree or shrub is in the form of a flag in wind.

Flange A rim or edge.

Fleshy Thickened and at least somewhat succulent.

Flexuous With curves or bends; zigzag.

Floccose Bearing tufts of long, soft, tangled hairs.

Floral tube An elongate tube primarily of the perianth, but may include other floral parts.

Floret A small flower, usually in a group or head of many, such as in the Asteraceae; a reduced flower in the Poaceae consisting of the flower proper and the lemma and palea.

Floricane A flowering and fruiting cane (shoot) of *Rubus*, usually second year or later.

Floricaulous Flowers borne on main stem or trunk; typical of many tropical genera, such as *Ficus*.

Floristics The study of plant occurrences and distribution.

Fluvial Pertaining to river sites.

Foliaceous Leaflike in form, color, and texture; pertaining to leaves; bearing leaves.

Foliose Leaflike; bearing leaves.

Follicle Dry, one-carpelled fruit opening along one longitudinal suture, as in *Asclepias*.

Forb A nongrass, herbaceous plant.

Fornix (plural **fornices**) One of a set of small scales or crests in the throat of a corolla, as in the Boraginaceae.

Fovea (**foveae**) A pit on a surface.

Foveate Pitted, with foveae.

Foveola (plural **foveolae**) A very small pit.

Foveolate With foveolae; minutely pitted.

Free Not joined to other similar structures or organs.

Free-central placentation In a unilocular ovary, ovules attached to a free-standing central structure.

Frugivorous Fruit-eating.

Fulvous Dull yellowish brown or gray; sometimes reddish brown.

Funicle (see **funiculus**).

Funiculus A stalk connecting an ovule to a placenta or seed to a fruit.

Funnelform In the shape of a funnel.

Fusiform Spindle-shaped, thicker in the middle, tapering at either end.

Galea The hoodlike upper lip of a two-lipped corolla that often encloses the style and stigma.

Galeate Structured with a galea.

Gelatinous Jellylike.

Gametophyte The 1*n* generation of a plant (or algal) life cycle that produces gametes; independent in mosses, liverworts, ferns, and fern allies, not free-living in gymnosperms and angiosperms.

Gemma (plural **gemmae**) A cluster of cells or a budlike structure that asexually propagates offspring plants from the parent plant.

Gemmate Having gemmae and/or reproducing by gemmae.

Gemmiferous Producing gemmae or buds.

Geniculate Possessing angular bends and joints.

Gibbous (see **ventricose**) Enlarged on one side.

Girdle A band of tissue around the middle of a fruit, flower, etc.

Glabrate Becoming glabrous in age.

Glabrescent (see **glabrate**).

Glabrous Completely hairless.

Gland A depression, cavity, protuberance, hair, or structure that secretes and accumulates an oil, wax, or sticky fluid.

Glaucescent Slightly glaucous or becoming glaucous.

Glaucous With a waxy covering, often appearing waxy..

Globose More or less spherical.

Globular (see **globose**).

Glochid Small, fine spine that often easily detaches from the areole, such as in *Opuntia*.

Glochidiate Barbed at the tip or bearing glochids.

Glomerule A headlike, often axillary, cyme as in some Asteraceae or Lamiaceae; a dense cluster.

Glume One of the pair of basal bracts on a spikelet in the Poaceae, a chaffy bract in the Cyperaceae.

Glutinous Sticky or covered with a gummy exudate.

Grain (caryopsis) The fruit of the grass family, the Poaceae (Gramineae), where the pericarp is usually fused to the seed coat.

Graminoid Grasslike.

Granite An igneous rock composed of coarse-grained, light-colored silicates.

Granitic Composed of or mostly composed of granite.

Granular With a grainlike texture, knobs, or swelling on a surface.

Granulate (see **granular**).

Great Basin Desert The intermountain cool, high-elevation desert that covers southwestern Oregon, California, Idaho, Nevada, Utah, western Colorado, northern Arizona, and northeastern New Mexico.

Groove A small furrow, usually in cacti, on a tubercle.

Guild An ecological group of organisms using environmental resources in the same or a similar way.

Gymnocarpy Bare seeds protruding from the cone or fruit.

Gynaecandrous Pistillate flowers borne above staminate flowers.

Gynobase An elongation of the receptacle, such as in the Boraginaceae.

Gynoecious Having only female flowers or cones, as in some cultivars.

Gynoecium The aggregate female parts of a flower; all the pistils of a flower.

Gynoecy The tendency to have female or pistillate flowers or cones.

Gynophore A stalk between the receptacle and the pistil, of receptacular origin.

Gynostegium A structure formed from the fusion of the androecium and gynoecium, as in the Asclepiadaceae, Apocynaceae.

Gypsophile A plant that grows on gypsum deposits (magnesium sulfate).

Habitat Where an organism lives or grows.

Half inferior A hypanthium that is fused to the lower half of the ovary; the flower parts appear to arise from the equator of the ovary.

Halophyte A plant that grows in a salty or hypertonic environment.

Hanging garden A local area in cliffs, or adjacent to a cliff, with water and more mesic, aquatic, and/or semiaquatic flora surrounded by dry vegetation associations.

Hastate With basal lobes spreading.

Haustoria Specialized roots that absorb water from the roots or stems of other plants, such as those possessed by mistletoes.

Hawkmoth A sphingid moth with a plump, hairy body and tapered, hairy wings, sometimes rather large, with a long proboscis. It is a major pollinator of large, light-colored, sweet-scented vespertine flowers and bright, low-growing tubular flowers, such as many species of *Mirabilis*.

Head (capitulum) Dense cluster of sessile or subsessile flowers on an expanded peduncle or receptacle.

Helicoid Coiled in a helix or spiral; such as in one-sided cyme inflorescences in the Hydrophyllaceae or Boraginaceae.

Hemiparasite Partial parasite in which the parasitic plant has chlorophyll and thus can photosynthesize, producing carbohydrates, such as in mistletoes.

Hemipollinaria Half a pollinarium, as in some species of *Platanthera*.

Herb A plant with soft, green growth that grows without producing wood or woodlike structures; a plant used for food, medical, or other ethnobotanical purposes.

Herbaceous (see **herb**).

Heterogeneity Possessing differences, as in an organism with differing alleles at a gene locus.

Heterophyllous A plant possessing different kinds of leaves.

Heterosporous An individual with two or more morphologically different spores, such as in some selaginellas and other ferns.

Heterostylous Possessing differing style forms.

Heterotrophic Drawing nutrition from digesting other organisms.

Heterozygote An organism (or cell) that contains two genetic forms of an allele.

Hilum A scar on a seed that indicates previous attachment to a placenta within the ovary.

Hippocrepiform Horseshoe-shaped.

Hirsute Stiff hairs that are ascending or spreading.

Hirtellous Minutely hirsute.

Hispid Rough, with bristly hairs.

Histology The study of plant tissues or plant anatomy.

Holocene A geological epoch from 10,000 years ago to the present.

Holoparasitic Completely parasitic; getting all nutrition and water from the host plant.

Homophyllous A plant possessing similar leaves.

Homosporous Having the same size spores; not differentiated into microspores and megaspores, resulting in one type of gametophyte with both male and female sex organs, as in some ferns.

Homostylous Possessing the same style forms.

Hook A curved tip, often sharp in cactus spines.

Horn Projection from flower parts or fruit as in *Proboscidea*; part of the corolla in *Asclepias*; long or short hornlike extensions from the gland ends of some species of *Euphorbia* subgenus *Esula*.

Hyaline Translucent; letting light through, but not transparent.

Hybridy Exhibiting the production of hybrids.

Hydroxy fatty acid A fatty acid (has a long chain of $-CH_2$s) with an extra hydroxyl group (-OH).

Hypanthium A cuplike structure on which floral parts are inserted, formed from the fusion of the calyx, corolla, and stamens.

Hypersupinate Twisted 360°, such as in some orchid flowers, with the lip uppermost.

Hypertonic An environment where the concentration of water is lower (and solute concentration higher) than inside a cell or plant.

Hypocotyl The portion of the stem in plant embryos just below the cotyledon(s).

Hypogaean (see **hypogeous**).

Hypogeous Beneath the ground.

Hypogynous With stamens, petals, and sepals attached below the ovary, with the ovary superior.

Imbricate With overlapping units, as imbricate petals.

Imparipinnate Odd-pinnate.

Imperfect (see **unisexual**) Having flowers that are either male or female.

Incised Irregularly cut with sharp teeth.

Included Not projecting beyond surrounding structures, such as stamens within a corolla tube.

Indehiscent Not opening along suture lines or pores when mature, as in some dry fruits.

Indeterminate An inflorescence that may continue to flower at the distal end of a stem or axis.

Indolizidine Alkaloids with one or more indole group(s).

Indument (**indumentum**) Collectively, the hairs, scales, waxes, etc., covering the epidermis of a plant.

Indurate Hardened.

Indusium (plural **indusia**) A thin flap that covers the sorus in ferns, derived from leaf epidermis; in the Onagraceae, a cuplike flap of tissue at the base of the stigma lobes.

Inferior ovary An ovary that is beneath other parts of the flower.

Infrastaminal Located below the stamens.

Infrastipular A structure located below the stipules.

Infusion A liquid produced from a plant part that is steeped or soaked without boiling.

Inrolled Curled inward; involute.

Insertion Where one structure is attached to another.

Integument The layer or tissue that covers the ovule and that will eventually become the seed coat

Intercostal Between the ribs or nerves.

Intermountain Region That region in the western United States that encompasses the Great Basin Desert as well as included and adjacent mountain ranges and plateaus.

Internode The part of the stem between nodes.

Interpetiolar Between adjacent petioles; usually of whorled leaves.

Interspecific Subdivisions of a species above the level of varieties; between species.

Intracalycine Within the calyx, as in the membrane found in the Gentianaceae.

Intraspecific Within a species.

Intrastaminal Within the stamen.

Intrataxon Within the taxon.

Introgression The movement of genes between species.

Introrse Turning or opening inward; toward the axis.

Intrusive Magma that cools slowly below the earth's surface; forming a coarse-grained rock such as granite

Investing aril Outgrowths of a seed from the chalazal region.

Involucel A small or secondary involucre, as in secondary umbels in the Apiaceae.

Involucre A subtending whorl of bracts (or phyllaries) subtending an inflorescence

Involute (see **inrolled**).

Irregular Flower parts in series that are somewhat varied, but not to the extent of zygomorphy, e g , *Gladiolus*

Joint The node on a stem; a stem unit in certain Cactaceae, especially chollas.

Jointed With the obvious appearance of real or apparent articulation.

Kayenta Navajo Navajo (Diné) people living or originating in the vicinity of Kayenta, Arizona, or on the western portion of the Navajo Nation.

Keel A prominent dorsal ridge; the two lower united petals of a papilionaceous (pealike) corolla.

Knot (see **chalazal knot**).

Kranz anatomy A specialized leaf anatomy that promotes a more efficient photosynthesis in C_4 metabolizing plants

Krummholz (see **flag**) Woody alpine or subalpine vegetation that is stunted and contorted due to extreme weather conditions.

Labellum (**lip**) A liplike petal, often modified as a landing platform for pollinators or other functions

Laccolith A massive igneous body intruded between preexisting strata and subsequently remaining as a mountain or plateau when weaker strata are eroded. Laccoliths found within the San Juan drainage include the Abajo Mountains, La Plata Mountains, Carrizo Mountains, Navajo Mountain, and Ute Mountain.

Lacerate Appearing torn; irregularly cut.

Laciniate Slashed into numerous narrow lobes.

Lacuna (plural **lacunae**) A gap within a tissue; an air space.

Lacunose Possessing lacunae.

Lacustrine Pertaining to lakes; of a lake; a sedimentary deposit typical of a lake.

Lamelliform Having the form of a thin plate or lamella.

Lamina (plural **laminae**) The blade or expanded portion of a structure, often referring to a petal.

Lanate Woolly; densely covered with long tangled hairs.

Lanceolate At least three times longer than wide, tapering to apex, widest below the middle.

Lanceoloid Somewhat lanceolate.

Lateral Located at the side of a structure.

Lateral spines Spines on the side or margin of the areole, usually thick, without a bulbous base but often similar in color (dark) to central spines.

Laticifer A channel through which flows latex or an opaque latexlike substance.

Latiseptate Possessing a broad septum.

Lax With the components, usually flowers or stems, separate and loose.

Leaflet A segment or leaflike portion of a compound leaf.

Leaf scar The scar left on a stem from a deciduous leaf.

Leathery With a leatherlike, thick, but flexible texture, usually referring to leaves.

Legume (see **pod**) A fruit, the product of a simple pistil, that dehisces along two sutures, typical of the Fabaceae (Leguminosae).

Lemma The lower of the two bracts that subtend a grass flower.

Lens A structure that is convex on both sides.

Lenticel A somewhat corky, sometimes lens-shaped area on the surface of a stem which serves as a gas exchange location.

Lenticular Lens-shaped.

Lepidote Covered with small, scurfy scales.

Liana A woody vine.

Ligneous Woody.

Ligulate Strap-shaped.

Ligule A strap-shaped organ; the flattened part of a ray floret corolla in the Asteraceae; a membranous structure arising from the inner surface of the leaf at the junction with the leaf sheath in the Poaceae (Gramineae) and many sedges; a projection at the base of the leaves above the sporangia in *Isoetes*. The expanded flat part of an organ, especially the flat part of a sympetalous corolla.

Linear Long and narrow, with parallel sides, as in many grass leaves; a straight, narrow line.

Lip (see **labellum**).

Lithophyte A plant that grows on rock; rupicolous.

Loam A friable type of soil composed of a more or less equal mixture of sand, silt, and clay, which drains well, yet retains moisture.

Lobed Indented, parted, divided; leaf may be shallowly, deeply, pinnately, or palmately lobed.

Locoism The tendency of certain ungulates to exhibit unusual behavior after eating certain plants, such as locoweeds (*Oxytropis*) and milkvetches (*Astragalus*).

Locule The cavity of an organ, primarily pistils and anthers.

Loculicidal Longitudinally dehiscent through the middle back, into the cavity, usually of a capsule or other hollow, dry fruit.

Lodicule Paired vestigial or rudimentary scales at the base of an ovary in grass florets.

Lunate Moon- or crescent-shaped.

Lyrate Lyre-shaped; pinnatifid with the terminal lobe large and the lower lobes much smaller or shallower.

Maculate Spotted or dotted.

Madro-Tertiary Geoflora An arid-adapted flora that first appeared in the Tertiary and expanded rapidly in the Miocene and Pliocene in southwestern North America.

Male cone (see **microsporangia**) A pollen-producing cone in conifers and other gymnosperms.

Malpighian (dolabriform) Straight hairs attached near the middle and tapering at both ends, shaped like a rock pick.

Mammiform Breast-shaped.

Mammillate With nipplelike structures on a surface.

Marcescent Withering but persistent, as in some basal leaves.

Margin The edge, such as the edge of a leaf blade or petal.

Marginal band A band of tissue at or near the margin of a leaf, petal, etc.

Marginal cell Cell located on the margin of a leaf blade, petal, or sepal; a cell of an outer wood structure.

Matutinal Flowers that open in the morning.

Mealy (see **farinose**) Covered with meal-like particles or secretions, as in goosefoot (*Chenopodium*).

Membranous Thin, soft, and pliable or papery.

Mephitic Skunklike, usually referring to smell; strongly foul-smelling or irritating.

Mericarp Unicarpellate segment of a schizocarp.

-merous Number of parts, e.g., a three-merous corolla.

Mesic A moist environment, as opposed to xeric (dry) or hydric (saturated).

Metaconglomerate Sedimentary rock that has experienced some metamorphic changes.

Metafixed (dolabriform, malpighian) Hairs that are attached to a surface at or near their midpoint.

Metamorphic Rock formed by the alteration of preexisting solid rock deep within the earth by pressure, heat, and/or chemicals. The rock does not become fully liquid in the process.

Microphyll A small, narrow, single-veined leaf of lower vascular plants, such as *Lycopodium*.

Micropylar (see **micropyle**).

Micropyle The opening in the integuments of the ovule through which the pollen tube enters.

Microsporangia (singular **microsporangium**) A microspore-producing structure.

Microspore Precursor to a male gametophyte and sperm.

Microsporophyll A stamen; a modified leaf or leaflike structure that bears one or more microsporangia.

Midpetaline band A band located midway along the petal, such as hairs or coloration.

Misappl. Designation of a name that has been or is incorrect in that it is not applied correctly to the taxon in question.

Mojave Desert The desert located in east-central California, southern Nevada, southwestern Utah, and northwestern Arizona. The indicator plant is *Yucca brevifolia* (Joshua tree).

Monad A single, free, individual structure; usually referring to pollen grains that are shed singly.

Moniliform Cylindrical, but constricted at regular intervals like beads on a string.

Monocarpic Flowering and fruiting only once in the life of the plant or shoot, which then dies, such as in some species of *Agave*.

Monocephalous A plant or inflorescence with one head or capitulum.

Monochasial With the form of a monochasium.

Monochasium A type of cymose inflorescence possessing a single main axis.

Monochazial (see **monochasial**).

Monoclinous Perfect, the male and female parts found within the same flower.

Monocot (monocotyledon) Plants that have only one cotyledon or seed leaf when germinating. Generally with parallel veins in leaves and flower parts in threes or sixes; includes grasses, orchids, palms, sedges, etc.

Monoecious Having staminate and pistillate imperfect flowers on the same plant; meaning "of one house" in Greek.

Monofoliolate With only one leaf.

Monomorphic With only one form; especially referring to flowers or leaves.

Monophyletic A clade (lineage) that includes its common ancestor and all of the ancestor's descendants.

Monophyly (see **monophyletic**).

Monotypic Having only one representative.

Monsoon A Southwest season in summer characterized by frequent thunderstorms with often heavy downpours and flash floods.

Moraine A formation composed of boulders, rocks, and/or other debris deposited by a glacier.

Morphology The overall form of a plant or its parts, such as leaves, flowers, sepals, indument, etc.

Mucilaginous Having a mucuslike substance.

Mucro A sharp tip.

Mucronate (**cuspidate**) With a short, abrupt, firm tip.

Mucronulate Tipped with a very small point or mucro.

Mudstone A fine-grained sedimentary rock formed from silt and clay and without laminations.

Multigeneric A hybrid formed of many genera, such as human-made hybrids in the Orchidaceae.

Multiple Fruit formed from closely clustered ovaries of many separate flowers, as in *Morus* or *Ficus*.

Muricate Possessing a small, sharp projection.

Murication A small, sharp projection or point.

Muriculate Very finely muricate.

Mutagenic Causing genetic changes in cells, which can lead to cancer or deformities.

Mycoheterotrophic (see **mycotrophic**).

Mycorrhizal fungi Fungi that form a mutualistic relationship with plant roots either as endomycorrhizae or ectomycorrhizae.

Mycotrophic (**saprophytic**) Obtaining nutrition with the aid of fungi that break down organic soil materials.

Myrmecochory The seed dispersal of plants by ants.

Myrmecophyte A plant that has a mutualistic relationship with ants, often providing specialized structures to maintain them.

Myxogenic Papillose hairs or apical achenial or cypselal pericarp hairs in the Asteraceae; mucilaginous cells.

n The haploid chromosome number; counted in developing pollen cells undergoing meiosis.

Napiform Turnip-shaped.

Naturalized Introduced plants, but now established and reproducing without human intervention.

Navajoan Desert A southern and eastern portion of the Great Basin Desert in Arizona, Colorado, New Mexico, and Utah that has differing geology and climate from the main unit. *Coleogyne ramosissima* (blackbrush) is the indicator plant.

Nebulose Indistinct, as in some fine inflorescences.

Necrotic Decaying or turning black.

Nectar A sugary solution secreted by plants, which may contain other materials such as amino acids. Often contained in nectaries, spurs, or bowl-like depressions in the perianth.

Nectar bowl A depression in a lip or other perianth segment that secretes and accumulates nectar for pollinators, such as in some species of *Malaxis*.

Nectar disc A disc or ring often at the base of the ovary or stamens that secretes nectar.

Nectar guide A line or lines of splotches on a petal or other flower structure that guides a pollinator to a nectary. The guides may be in ultraviolet pigmentation, detectable mainly by insects, but also by some bats; minimally by some hummingbirds.

Nectariferous Producing nectar.

Nectary A tissue or group of cells that secrete nectar. Nectaries may be found inside or outside flowers that attract ants to aid in a plant's defense.

Nectary disc A round structure, often below the ovary, that secretes nectar.

Needlelike (see **acerose**, **acicular**).

Neotropical Geoflora The ancient tropical forests that existed in tropical regions of North, Central, and South America at the beginning of the Tertiary.

Neotropics Tropical regions of the Western Hemisphere.

Nerve Major large vein or midrib.

Neuter Lacking both functional stamens and pistils.

Nivation Related to late-lying snowbanks.

Nocturnal Blooming or active at night, such as *Datura wrightii*.

Nodal Occurring at the node or nodes; pertaining to a node or nodes.

Node The stem joint; where buds, leaves, inflorescences, and new stems arise.

Nodulose Finely knobby.

Nom. cons. Name conserved, sometimes over a name with priority.

Nomen confusum Confused name.

Nonaccrescent Not accrescent; not becoming larger with age.

Noncircinate Not coiled from the tip down, as in some young fern fronds.

Nut A one-seeded, indehiscent fruit with a hard or woody pericarp, as in acorns of *Quercus*.

Nutlet A small nut; a section of a mature ovary in the Boraginaceae, Verbenaceae, and Lamiaceae (Labiatae).

Obconic Cone-shaped, with the attachment at the narrow end.

Obcordate As cordate, but with attachment at narrowed end and notch at apex.

Obdeltoid Deltoid, with the attachment at the narrow end.

Obdiplostemonous Having two whorls of stamens, the outer whorl opposite the petals, the inner whorl opposite the sepals.

Oblanceolate As lanceolate, but tapering to the base and widest above the middle.

Oblate Generally spheroid, but flattened at the poles.

Oblique Asymmetrical by having unequal sides.

Oblong Longer than broad, with margins parallel and ends rounded.

Oblongoid Tending toward oblong.

Obovate As ovate, but tapering to the base and widest above the middle.

Obovoid Obovate, but three-dimensional.

Obpyrimidal Appearing as an upside-down pyramid, three-dimensional triangle.

Obscure Minute or difficult to observe; not immediately obvious.

Obsolete Rudimentary or vestigial.

Obtrullate Trowel-shaped, with attachment at the narrow end.

Obtuse Forming an angle of greater than 90°.

Ochroleucous Off-white, buff.

Ocrea (plural **ocreae**) A sheath around the stem formed by stipules, as in some Polygonaceae.

Ocreate With ocreae.

Ocreola (plural **ocreolae**) A minute, stipular sheath around the secondary inflorescence divisions in some Polygonaceae.

Oil tube Narrow ducts in the fruit of many Apiaceae which contain volatile oils.

Olivaceous Olivelike or olive-green in color; like olivine or its geological relatives.

Opiate Alkaloids commonly found in sap, resin, or latex of the Papaveraceae and other families.

Opposite Arranged with two opposing structures, as in opposite leaves where there are two at a node on opposing sides; one part in front of another, as when sepals and petals align with one another.

Opuntioid A cactus in the subfamily Opuntioideae including the genera *Cylindropuntia*, *Grusonia*, and *Opuntia*; prickly pears, club-chollas, and chollas.

Orifice A mouth or opening, as in the opening of a tubular corolla.

Orographic Precipitation that occurs due to a movement of an air mass to higher elevations and cooler temperatures, resulting in lower moisture-holding capability of the air mass (higher relative humidity) and deposition of precipitation, such as on mountaintops.

Ovate Egg-shaped in outline, less than three times as long as wide, tapering to the apex and widest below the middle.

Ovoid Ovate, but three-dimensional, egg-shaped.

Oxalic acid An organic acid produced by certain succulents and members of the Oxalidaceae or Chenopodiaceae; an intermediate metabolite in photosynthesis and respiration, especially important in CAM and C_4 metabolism.

Palatal Possessing a palate in the floral structure.

Palate A raised structure on the lower lip of a corolla that almost completely obscures the throat, as in some flowers of *Penstemon*.

Palea (plural **paleae**) A chaffy scale or bract; the uppermost of two bracts that subtend a floret in the Poaceae; a chaffy scale or bract on the receptacles of some members of the Asteraceae.

Palmate Arranged in a palmlike fashion, spreading.

Palmatifid Palmately cleft or lobed.

Palustrine Growing in wet meadows or marshes.

Pandurate Fiddle-shaped.

Panduriform (see **pandurate**).

Panicle Compound or branched raceme.

Paniculiform With the basic appearance of a panicle, but not necessarily the morphology or developmental sequence of a panicle.

Pannose With a short, dense, felt-like, tomentose covering.

Papilionaceous Pealike floral morphology, with an upper petal (the banner or standard), two lateral petals (the wings), and a forward-projecting keel of two apically fused petals.

Papilionoid Having a pealike zygomorphic flower in conformation, such as in papilionoid plants of the Fabaceae.

Papillae Pimplelike or blisterlike structures, usually on the epidermis.

Papillate Having papillae.

Papilliform (see **papillae**).

Papillose With minute papillae.

Pappus (plural **pappi**) Modified calyx on florets of the Asteraceae. These may be awns, scales, or bristles at the achene or cypsela apex.

Paraphyletic A clade (lineage) that has a single common ancestor but which does not include all of the ancestor's descendants.

Parasite (see **hemiparasite**) An organism that obtains its food and water from another organism.

Parenchyma A type of tissue that is generalized in cell type, has a thin cell wall, and is often used for food storage.

Parietal Attached to the outer wall of the ovary, as in parietal placentation, where the ovary has only one locule and the placentae are arranged around the outside of the locule.

Park A large montane meadow.

Parkland Patchy forested land with clumps or individual trees, usually separated by grassy meadows or expanses of much shorter vegetation.

Pectinate Comblike; with closely spaced appendages or hairs often in a single row.

Pedate Palmately divided, with lateral lobes two-cleft.

Pedatisect Palmately lobed, with lateral lobes two-cleft.

Pedicel The stalk of a single flower in an inflorescence or of a spikelet in grasses.

Peduncle The stalk subtending an inflorescence.

Pellicle A thin, membranous, or skinlike covering.

Pellucid Transparent or translucent.

Peltate With stalk attached to lower surface of leaf blade or other structure well inside the margin.

Pendulous Hanging downward, usually somewhat loosely.

Penicil A tuft of short hairs, usually in brushlike form.

Penicillate With a brushlike tuft of short hairs; with a penicil or penicils.

Penultimate The next to the last.

Pepo A type of berry that has a hard or leathery rind exocarp, many seeds, and a usually fleshy (sometimes fibrous) mesocarp; usually one-loculed; typical of the Cucurbitaceae.

Perennate Renewing or regrowing, as in the regrowth of shoots.

Perennial A plant that lives for three or more years.

Perfect (bisexual, hermaphrodite) Having both pistil(s) and stamen(s) on the same flower.

Perfoliate The margins (usually of a leaf) entirely surrounding the stem, giving the impression of the stem passing through the leaf.

Perforate With holes or other small openings.

Perianth Collectively, the calyx and corolla.

Pericarp The wall of a fruit, usually derived from ovary tissue, but sometimes derived from an accessory structure, often with exocarp, mesocarp, and endocarp.

Pericarpel A structure consisting of the upper portion of the flower-bearing stem, the receptacle, and the lower portion of the pistil.

Periderm A layer of outer tissue, often corky, in plant stems.

Perigynium A sac often enclosing an achene in the Cyperaceae.

Perigynous A flower possessing a tubular hypanthium on which occur stamens, petals, and sepals. The calyx tube surrounds, but is not attached to, the superior ovary.

Perisperm Food storage arising from the nucellus, or maternal tissue, in some seeds, around or near the seed.

Perispore The outer covering of a spore.

Persistent Remaining attached, as a style on a fruit.

Petal The individual segment of the corolla, the second whorl (moving inward) of the flower perianth.

Petal hood The structure formed when a petal arches or curves to form a hood; when a sepal arches over a smaller petal to form a hood.

Petaloid Petal-like; may be a stamen, sepal (as in many Cactaceae), style (as in *Iris*), other flower part, an entire flower (as a ray floret in the Asteraceae), or a bract (as in *Poinsettia*).

Petiole The stem or stalk attached to the leaf blade in a leaf.

Petiolule The stem or stalk attached to a leaflet.

Phenological spring The time period when leaves emerge from deciduous plants, later at higher and cooler elevations, sooner at lower and warmer ones.

Phenological summer The time period when photosynthesis in plants is at its greatest rate.

Phenology The sequence of events in a plant's life; usually referring to flowering and fruiting events.

Phloem The sugar-containing conductive tissue in plants, part of the inner bark.

Phyllary A bract of the involucre, such as in the Asteraceae.

Phyllode A leaflike petiole lacking a true leaf blade.

Phyllodial Pertaining to a phyllode.

Piki A type of very thin, membranous flatbread (not leavened) often made from ground corn and other ingredients by Puebloan peoples. Originally, the batter was spread and toasted on a hot, flat rock.

Pilose (includes villous, velutinous) Soft, distinct, straight hairs that are ascending or spreading.

Pilosulous With minute, soft, straight hairs.

Pin A flower that has an elongated style.

Pinna (plural **pinnae**) A lobe of a pinnatifid leaf, petal, etc.

Pinnate Arranged in a fashion similar to a feather; fernlike.

Pinnatifid Pinnately lobed almost to the point of being pinnately compound.

Pinnatisect Pinnately cleft to the midrib of a leaf.

Pinnule The ultimate division of the blade in a bipinnately or more compound leaf.

Pistil The gynoecium, female parts of the flower: ovary, stigma, and style.

Pistillate With pistils; imperfect female flowers or the inflorescences that contain only this flower type.

Pit A small depression; the endocarp of a drupe, such as in *Prunus*; small opening in the walls of tracheids and vessel elements that allows water to move from one cell to another in xylem.

Pithy With spongy tissue in the central area of roots and stems, as in some Poaceae.

Placenta (plural **placentae**) The attachment place of the ovule.

Placentation The arrangement or configuration of the placentae in the ovary.

Plane Three-dimensionally flat, such as a leaf without an undulate margin.

Plano Flat.

Plano-convex Flat on one side and convex, or extruded, on the other.

Pleistocene A geological epoch which extended from 1.8 million to 10 thousand years ago.

Plica (plural **plicae**) A fold or braidlike structure.

Plicate Plaited, pleated, or folded similar to a fan, such as the leaf blades of *Calypso bulbosa* or the corolla in many Gentianaceae and Solanaceae.

Plumose Plumelike; feathery with hairs or fine bristles on both sides of the main axis.

Plurilocular Containing many locules or compartments.

Pod (see **legume**).

Podogyne (see **carpophore**) A stipe supporting an ovary.

Pollen cone A cone that produces pollen; a male cone, usually deciduous.

Pollen sac The portion of an anther or cone scale that contains the pollen.

Pollinarium (plural **pollinaria**) A structure in the Orchidaceae and Asclepiadaceae (Apocynaceae) that contains pollinia and other structures that facilitate pollen transport by pollinating insects, birds, etc. Usually one anther in orchids (two in *Cypripedium*); may be two half-anthers in milkweeds.

Pollinium (plural **pollinia**) A mass of pollen grains forming a transportable unit with other parts of a pollinarium, as in the Orchidaceae or Asclepiadaceae (Apocynaceae).

Polyad A group of pollen grains; chromosomes that group more than two at meiosis.

Polycarpic Flowering more than once.

Polygamodioecious Primarily dioecious, but with a few perfect flowers.

Polygamomonoecious Primarily monoecious, but with a few perfect flowers.

Polygamous Bearing imperfect and perfect flowers on the same plant.

Polymorphic Having many different forms.

Polypetalous A corolla of completely separate petals.

Polyphyletic An artificial taxon having more than one evolutionary origin, despite the similarity of characters.

Polyploidy Having more than three haploid sets of chromosomes.

Polysporangiate Giving rise to many sporangia.

Poricidal Opening by pores, as in capsules of the Papaveraceae.

Porrect Resembling a parrot beak and extending forward; usually a flower part.

Pouch A petal or other structure that has a compartment with an opening on top, such as the labellum of *Cypripedium*.

Precocious Flowering before the appearance of leaves.

Prickle Epidermal outgrowth, easily removable, without vasculature and more substantial than most trichomes, as in *Rosa*.

Prickle Small prickle.

Primocane The first-year cane or shoot, often nonflowering, in many species of *Rubus*.

Priority The taxonomic rule that the earliest valid name has precedence in use over later names.

Proboscis Nose or noselike projection.

Procumbent Lying on the ground, but not rooting in it.

Prokaryote Single-celled organism that lacks a nucleus or other cell organelles.

Pro sp. As a species.

Prostrate Growing or lying flat on the ground or substrate.

Protandrous A type of flower in which the anthers release pollen before the stigma is receptive.

Prothallium A gametophyte, often heart-shaped or carrot-shaped, in ferns and fern allies, such as selaginellas and equisetums.

Protogynous A condition in which the stigma(s) are receptive before the anthers release pollen.

Prow-tipped Possessing an upward-curving spine or other structure at the tip of an organ.

Proximal Toward the base or axis.

Pruinose Conspicuously glaucous with a waxy, whitish, grayish, or bluish bloom (coating) on the surface.

Psammophyte A plant that grows in sand.

Pseudobulb An enlarged stem that is able to store water and food, especially in orchids.

Pseudocereal A grainlike fruit that is not in the Poaceae but another family, such as Amaranthaceae.

Pseudohermaphrodite False perfect flower, where one sex is nonfunctional chemically or anatomically.

Pseudomonomerous A structure that appears to be simple, though derived from the fusion of two or more separate structures, as a cypsela derived from ovary and calyx tissue.

Pseudoscape Where not all leaves are truly basal.

Pseudostamen A false stamen, usually on the petal, often bright yellow; used to attract insects, as in *Calypso*.

Pseudostaminode (plural **pseudostaminodia**) A false staminode, or false stamenlike structure.

Pseudoterminal Falsely terminal.

Pseudowhorled Falsely appearing whorled, as the leaves of some species of *Galium* where some of the "leaves" are actually stipules.

Puberulent Minutely pubescent.

Puberulous (see **puberulent**).

Pubescent Bearing hairs.

Pulvinate Cushionlike or matlike.

Pulvinus (plural **pulvini**) A swelling, usually at the node of a stem or the base of a petiole or petiolule, especially in the Poaceae or Caryophyllaceae.

Punctate Dotted with holes, depressions, spots, or translucent glands.

Pustulate (see **pustulose**).

Pustulose With small blisters or pustules, often at the base of a hair, as in many species of *Cryptantha*.

Putative Generally regarded as true, although facts may be inconclusive.

Pyramidal Three-dimensional equivalent of triangular.

Pyriform Pear-shaped.

Pyxis A capsule with the top coming off lidlike; a circumscissile capsule.

Quadrate Squared.

Quadrilocular With four cavities or compartments.

Quassinoid A bitter alkaloid typically found in the Simaroubaceae.

Quinolizidine alkaloid An alkaloid containing quinolizidine ring(s). Often colored.

Raceme Indeterminate inflorescence bearing several pedicelled solitary flowers along a central axis.

Racemiform Racemelike in overall appearance, but not actually in morphology or development.

Rachilla A small rachis, usually the axis of a grass spikelet or sedge inflorescence.

Rachis The axis or stem of a spike, raceme, or a compound leaf.

Radial spine One of the outermost spines of an areole, often radiating or appressed, usually fine and lighter colored than central spines.

Radiate With parts spreading from a single point; when some of the flowers in a head are ligulate, especially on the outer whorl as in the Asteraceae.

Ramada (shade) A shaded outdoor working area usually built of pole logs and leafy branches (palm leaves in warmer climates) or branches with bark.

Ramah Navajo Navajo people who live or originate on the Ramah Navajo Reservation near Ramah, New Mexico, southwest of Gallup; apart from the "big reservation" to the north and west.

Rame A branch, usually herbaceous; a cluster of spicate racemes.

Rank Row, as in three-ranked; also refers to category, i.e., genus vs. family, etc.

Raphe A ridge located on a seed formed by part of the funiculus fused to seed coat tissue.

Raphial cavity A cavity within the raphe.

Ray The straplike part of a ray or ligulate floret or the flower itself in the Asteraceae; a branch of an umbel, especially in the Apiaceae.

Ray floret A flower in a head of an Asteraceae inflorescence that has petals fused into a straplike structure, often in the outer whorl of florets.

rDNA Ribosomal DNA, the genes that code for ribosomal RNA (ribonucleic acid).

Receptacle Terminal portion of the flower stalk, often inflated, from which arise the flower parts.

Reclining More or less horizontal in form.

Reflexed Bent downward.

Relict taxon A taxon that appears "out of place," with no known close relatives. Typically these taxa and their relatives have a long evolutionary history in the region and have persisted for long periods of time, such as *Berberis* and *Paxistima*.

Relictual An "out of place" population or taxon of plants. The population may be a "leftover" from a retreating ice age or other geoclimatological event or may be an evolutionary relict, unrelated or not obviously related to other known plants in the area.

Remote Spaced distantly.

Reniform Kidney-shaped.

Repand With a slightly wavy, sinuate, or undulate margin.

Replum Partition between two locules of siliques or silicles.

Resin A liquid defensive material secreted by plants, often translucent, common in gymnosperms and the Burseraceae.

Resupinate The flower twisted with the lip uppermost; the flower with the lip lowermost, twisted 180° (see **hypersupinate**), as in some orchids.

Reticulate (reticulation) Net-veined; with a network, or netlike markings or structure.

Retting A process of partial bacterial and fungal decomposition of, primarily, flax (Linaceae) stems to a usable and strong fiber.

Retuse Shallowly notched.

Revolute Rolled backward from both margins toward the underside.

Rhizomatous Possessing rhizomes; rhizomelike.

Rhizome An underground stem possessing nodes.

Rhizophore In selaginellas, a downward-growing, leafless shoot that may produce roots at its apex.

Rhombic Rhomboid-shaped in cross section or outline; a polygon with four equal-length sides, two equal angles greater than 90°, and two equal angles less than 90°.

Rhyolite An igneous volcanic rock of felsic composition; fine-grained.

Rib Ridge of stem tissue parallel to the stem axis in cacti with areoles; the woody underlying skeleton of fleshy ribs in cacti; a raised line of tissue, such as veins or a line in dry fruits.

Rim Edge of a rock outcrop or bench, often of sandstone.

Rimrock A sandstone ledge.

Ring chromosome A group of chromosomes, as in some Onagraceae, that form a ring at meiosis.

Riparian Vegetation found in a river valley or other flowing water community, sometimes referring to seasonally dry wash vegetation.

Robust Vigorous in growth and anatomy; sometimes stocky, not thin.

Root The portion of a plant usually belowground, lacking nodes, leaves, and buds at nodes.

Rootstock The part of a root from which the main stem arises.

Rosette A cluster of radiating leaves arising from a short or underground stem close to ground level.

Rostellum A small beak; an often clawlike extension of the stigmatic upper edge on an orchid column.

Rostrum A beaklike structure such as that on the column of Orchidaceae flowers.

Rosulate Leaves arranged in basal rosettes; the stem short or absent.

Rotate Wheel-shaped; usually referring to the limb of a corolla.

Rotund Rounded.

Rounded Forming a semicircular shape.

Ruderal Weedy or growing in regularly disturbed habitats.

Rudiment Vestigial or imperfect in development; a part of a structure.

Ruga (plural **rugae**) A fold or wrinkle.

Rugose Wrinkled or furrowed.

Rugulose Minutely wrinkled or furrowed.

Runcinate Sharply pinnatifid or cleft, with the segments pointing downward.

Saccate With a sac; bag-shaped.

Sagittate Shaped like an arrow, with two backward-directed lobes.

Salverform A narrow tube, usually a corolla, abruptly expanding to a flattened portion.

Samara Dry, indehiscent, winged fruit, as in *Acer* or *Ulmus*. May be schizocarpic, as in *Acer*.

Sandstone A sedimentary rock formed from sand granules (usually quartz) and a cementing agent.

Scaberulous Intermediate between scabrous and minutely pilose.

Scabrescent Minutely scabrous.

Scabrid Roughened.

Scabridous Possessing a scabrid surface.

Scabrous Rough to the touch.

Scale A thin, small bract, vestigial leaf, sepal, or petal; a flattened, wide trichome.

Scale leaf A small, scalelike true leaf, as in junipers.

Scandent Climbing or slightly viny.

Scape A leafless peduncle arising from the ground in acaulescent plants.

Scapose Bearing a scape.

Scarious Thin, dry, membranous; not green.

Schizocarp Dry fruit splitting into one- or few-seeded segments, as in many Apiaceae.

Sclereid A type of sclerenchyma cell with a very thick, ligneous cell wall and a roundish or many-sided shape.

Sclerenchyma A type of plant tissue with a very thick secondary cell wall, usually containing lignin. Typical cell types include fibers and sclereids.

Scorpioid A coiled cyme, shaped like a scorpion's tail, as in some plants of the Boraginaceae and Hydrangeaceae; a zigzag rachis of a determinate inflorescence.

Scree Loose rock debris covering a slope; the accumulation of sloping loose rock debris at the base of a cliff or steep incline.

Scrotiform Scrotumlike in appearance; a drooping pouch or sac.

Scurfy (**lepidote**) Covered with small scales.

Secondary partition Not a major partition; usually thinner-walled or partially walled.

Secund Arranged on one side of a rachis or axis, such as in some species of *Penstemon*.

Seed cone The female cone, usually woody and larger than the pollen cone, such as in conifers.

Seleniferous Soil or structure containing high amounts of selenium or its salts.

Selenophyte A plant that grows in an area of high soil selenium concentration, as some species of *Astragalus*.

Semifoliaceous Somewhat leaflike, such as some bracts or petals.

Seminiferous Seed-bearing; semenlike scent in some fly-pollinated orchids.

Semisucculent Somewhat fleshy.

Sensu In the sense of.

Sensu lato In the broad sense.

Sensu stricto In the narrow sense; narrowly.

Sepal A segment of the calyx; the outer whorl of the perianth.

Sepaloid Sepal-like in color and/or texture, but not actually a sepal, or part of the calyx.

Septate Divided by one or more partitions or septa.

Septicidal Dehiscence of a capsule between locules.

Septum (plural **septa**) Partition separating cavities, as in an ovary.

Sericeous (see **silky**).

Serotinous Remaining unopened for a long time, especially as referring to the cones of some pines that require the heat of a fire to open.

Serrate With pointed teeth facing toward apex.

Serrulate Minutely serrate.

Sessile Attached directly by the base, not stalked.

Seta (plural **setae**) A bristle or bristlelike.

Setiform Possessing a bristlelike morphology.

Setose Possessing setae or bristles.

Sheath Tubular basal portion of a leaf that encloses a stem in the Poaceae and Cyperaceae; in *Opuntia* and *Cylindropuntia*, a papery, tubular, epidermis-derived layer that encloses a spine, which sometimes separates from the spine at the tip; the papery bract or scale that encloses bundles of needles in the Pinaceae.

Short-hirsute (**hirsutulous**, **hirtellous**, **hirtellate**, **hispidulous**) With short, stiff hairs.

Short-pilose (pilosulous, villosulous) With short, soft, ascending hairs.

Short-strigose (strigulose, strigillose) With short, stiff hairs that are closely appressed.

Short-woolly With short, soft, dense hairs.

Showy Obvious; large and often colorful.

Shrub A woody perennial plant with several or more stems.

Sigmoid S-shaped.

Silicle (silicula) A dry fruit less than three times longer than broad, dehiscing by two valves, with seeds attached to a central, persistent rim (**replum**) usually spanned by a membrane, as in the Brassicaceae.

Silique (siliqua) A dry fruit more than three times longer than broad, dehiscing by two valves, with seeds attached to a central, persistent rim (**replum**) usually spanned by a membrane, as in the Brassicaceae.

Silky Soft, distinct, straight hairs that are closely appressed.

Siltstone A fine-grained sedimentary rock of lignified silt.

Simple Unbranched; without leaflets or not compound.

Sinuate Wavy on margins only, not three-dimensional.

Sinus A cleft between two lobes of an organ such as a leaf (or petal).

Sister relationship Two taxa that are each other's closest relative.

Slickrock Smooth sandstone polished by wind and water.

Sobole Elongated caudex branch or a shoot arising from the stem base or an underground stem.

Sodgrass A grass that spreads vegetatively by rhizomes or stolons.

Solifluction Mass soil movement resulting from freeze-thaw action.

Solitary Borne singly.

Sordid Muddy, brownish gray, or any dull color.

Spathe A large, often colorful or showy bract subtending and often surrounding a usually spikelike inflorescence, such as in the Araceae.

Spatulate Oblanceolate, but apex broadly rounded, tapering at the base, like a spatula.

Spherical Round in outline; three-dimensional.

Spicate Spikelike.

Spiciform (spiceriform) An inflorescence that has the appearance of a spike, but not necessarily the true morphology or development of a spike.

Spike Indeterminate inflorescence bearing sessile or subsessile solitary flowers along a central axis.

Spikelet A section of a larger inflorescence similar in conformation to a spike, the ultimate flower cluster in grasses which consists of two glumes and one or more florets; flower cluster in sedges.

Spine Modified leaf or leaf parts, including stipules, as in the Cactaceae.

Spinescent Bearing a spine or spines.

Spine sheath A layer of epidermis found in some cacti which may become detached from the spine.

Spinose (spinous) Bearing spines.

Spinulose Bearing a small spine or spines.

Sporangium (plural **sporangia**) A structure that produces spores in plants, usually by meiosis.

Sporeling A young plant just arising from a spore.

Sporocarp A structure on some ferns, such as *Marsilea*, that contains sori and sporangia.

Sporophyll A spore- or sporangium-bearing leaf; a fertile leaf; a structure containing sporangia.

Sporophyte The generation in plants that produces spores, usually $2n$.

Spreading Branching in close to horizontal fashion.

Spur An enclosed, often nectar-containing extension from the corolla or calyx.

Spurred Bearing a spur or spurs.

Squamella (plural **squamellae**) A small scale or squama.

Squarrose Rough or scurfy, with spreading processes, recurved at the tips, as in some involucres of bracts.

Stamen The male pollen-bearing portion of the flower; the microsporophyll; composed of anther and filament.

Staminate Containing stamens; an imperfect male flower or the inflorescence that contains only this flower type.

Staminode (plural **staminodia**) A sterile stamen, sometimes petaloid, resembling another structure, or otherwise modified.

Stereome A border of hyaline cells; the central area of the phyllary in the Asteraceae.

Sterile Not capable of producing viable pollen, ovules, gametes, or spores.

Stigma The receptive sticky or feathery part of the pistil on which the pollen is deposited and germinates.

Stigmatic cap The tissue that seals the top of the inrolled developing pistil, often with projections or papillae; especially in plants with "dry" stigmas.

Stipe (see **gynophore**).

Stipiform Stalklike; stipelike.

Stipitate With a stipe or gynophore.

Stipulate With small stipulelike or substipulelike projections; bearing stipules.

Stipule One of the pair of leaflike appendages at the base of some leaves.

Stolon Thin, usually long, often trailing stems that produce new plants at the tip or nodes.

Stoloniferous Bearing a stolon or stolons.

Stoma (plural **stomata**) A gas exchange pore, usually on the underside of the leaf, generally flanked by two guard cells.

Stomatal band A row of stomata, usually on leaves or needles in conifers.

Stramineous Strawlike in texture or color.

Striate Striped with longitudinal lines or furrows.

Strict Straight and upright, not spreading; in a somewhat narrow sense.

Strigillose Minutely strigose.

Strigose Stiff hairs that are closely appressed.

Strobilus A cone that produces spores and/or seeds and/or pollen and/or gametophytes.

Strophiole In some seeds, such as in the Portulacaceae, an appendage at the hilum.

Stylar Pertaining to the style.

Style The portion of the pistil between the ovary and the stigma.

Stylopodium A disclike structure at the base of the styles in the Apiaceae.

Sub- Slightly less or almost.

Submersed Submerged.

Subprecocious Flowering slightly before the appearance of leaves.

Subshrub (see **suffrutescent**) A perennial plant with a woody lower portion.

Subspecies A unit of classification inferior in rank to a species.

Subspecific Referring to a rank below species, such as variety and subspecies.

Subsume Decrease the importance of.

Subtended Immediately below and close to another structure. Typically, a bract.

Subulate Long, narrow, tapering gradually to a rigid apex; awl-shaped.

Succulent Juicy or fleshy, as in the Cactaceae or families such as the Crassulaceae or Agavaceae.

Succurent Extending upward and adnate to an axis.

Suffrutescent (see **subshrub**) Shrublike; slightly woody.

Suffruticose Somewhat shrubby; having a stem that is woody only at the base.

Suffrutose (see **suffrutescent**).

Sulcate With grooves or furrows, usually longitudinal.

Superior ovary An ovary that is free from or above other organs in the flower.

Suture On a fruit or other structure, a line that may result in dehiscence or is the result of union between or among various parts.

Sympatric (**sympatry**) (see **allopatric**). Occupying the same geographical region, as in sympatric species.

Sympodial Consisting of a number of short axillary branches, often underground.

Synapomorphy A derived trait that is shared by two or more taxa and which reflects their shared ancestry.

Synconium A fleshy multiple accessory fruit typical of *Ficus*, with the receptacle enlarged and enclosing a cavity with many small, partially embedded, achenelike structures with seeds.

Synoecious When a head or other inflorescence contains both staminate and pistillate flowers.

Synonym Name of a plant family, genus, species, etc., which, for various reasons, is no longer valid but generally represents the equivalent taxon.

Synsepal Two sepals fused together in cypripedioid orchids.

Syrphid fly A fly pollinator that behaves ecologically like a bee or wasp.

Talus A layer of broken rock, individually boulders to small in size, usually on a slope or below a cliff.

Taproot A thick, fleshy, main or primary root that functions in food and water storage.

Tardily Produced later than usual.

Tarn A small mountain lake usually formed from a glacier; a cirque filled with water.

Taxon (plural **taxa**) A representative of a unit of taxonomic classification, such as a species.

Tendril Part or all of a stem, leaf, or petiole modified to form a threadlike structure, which may coil around objects for support.

Tepal Sterile sepaloid or petaloid structure of the flower when the perianth parts are not differentiated into calyx and corolla, as in many monocots and many cactus flowers.

Terete Round in cross section.

Terminal At the end of a stem or structure.

Ternate A leaf divided into three leaflets, usually where it is difficult to determine if it is pinnately compound or palmately compound.

Terpene An organic compound, often a component of plant resins.

Terrestrial Growing in or on the ground; not aquatic, epiphytic, or lithophytic.

Tertiary A geological period extending from 65 to 1.6 million years ago.

Tessellate With a checkered pattern.

Testa The seed coat, which develops from maternal sporophytic tissue; the integuments.

Testicular Resembling testicles; relating to the testa.

Tetrad A group of four, usually referring to pollen that is shed in groups of four grains.

Tetradynamous Flowers with four long and two short stamens, as in the Brassicaceae.

Tetraploid Possessing an extra complete diploid set of chromosomes.

Theca (plural **thecae**) A pollen sac or anther cell.

Thecum One half of the anther cell.

Thigmotropic Responding to touch, as in *Mimosa pudica*; a sensitive plant.

Thorn Modified, sharp stem, such as in *Condalia* or *Elaeagnus*.

Throat The portion of the corolla between the limb and the tube; the opening or orifice in a zygomorphic corolla; the upper margin of the leaf sheath in grasses.

Thrum (see **pin**) A flower with a short style.

Thyrse A panicle that is more compact and oval in shape than usual and with an indeterminate main axis.

Thyrsiform Thyrselike, but may not be an actual thyrse.

Thyrsoid Thyrselike.

Tiller A generally erect shoot of underground or basal origin, usually referring to grasses.

Timberline The line marking the upper limit of normal tree growth.

Tomentose With rather short, densely matted, soft, whitish, woolly hairs.

Tomentum Woolly, short, soft covering of hairs.

Torulose Slightly constricted at intervals, with a generally cylindric form.

Toxicosis A diseased condition resulting from poisoning.

Tracheid A thin, tapered, end-perforated cell wall (the cell itself is dead) in xylem which functions to conduct water; considered to be less evolved than vessel elements.

Translator Part of the pollinarium of the Asclepiadaceae (Apocynaceae, in part) which connects the pollinia of adjacent anthers.

Travertine A type of limestone deposited in watery environments by bacteria, typically cyanobacteria.

Tree A woody perennial with one or a few main trunks.

Triangular (see **deltoid**, **deltate**) Having the form of an equilateral triangle.

Trichome A hairlike, scaly, or prickly outgrowth of the epidermis.

Trichotomous Three-forked.

Tridentate Three-toothed.

Trifid Three-cleft or three-parted.

Trifoliolate (trifoliate) With three leaves or three leaflets.

Trigonate (trigonous) Three-angled.

Trilete A trifurcate mark on spores that indicates where the three other spores in a tetrad attached during development.

Tripartite Three-parted.

Tripinnate A leaf pinnately compound three times, with each pinnule pinnately compound.

Truncate Cut off squarely.

Tube A hollow, cylindrical structure, as in the corolla of some flowers.

Tuber A short, usually thickened, underground storage stem with buds at the nodes, such as in potatoes.

Tubercle Short, usually rounded, nodule or projection, as in the Cactaceae; a persistent style base in the Cyperaceae.

Tubercule (see **tubercle**) Small rounded propagules or other rounded projecting structures; a small tuber.

Tuberoid A thickened root that resembles a very small tuber.

Tuberosity A structure or protuberance that resembles a tuber in shape.

Tuberous Resembling a tuber in form.

Tubular Forming a tubelike hollow structure, usually fused parts of a calyx or corolla.

Tuff A volcanic rock composed of compacted volcanic ash.

Turbinate Top-shaped.

Turf Densely packed grasses or grasslike plants.

Turgid Swollen or inflated.

Turion A small shoot that often overwinters, as in some Cyperaceae and *Epilobium*.

Tussock A large, tufted growth of sedges or grasses.

Twining Coiling around a support and climbing.

2n The diploid chromosome number; counted in root tip cells undergoing mitosis.

Ultimate The final or top section of a structure.

Umbel Indeterminate inflorescence with pedicels usually of similar length arising from one point, sometimes flat-topped, simple or compound.

Umbellate Umbel-like.

Umbellet An umbellate cluster of an umbel.

Umbilicus A navel-like structure, such as a hilum.

Umbo A blunt protuberance, as on the ends of some pine seed cones.

Uncinate Hooked at the tip; clawlike.

Undulate Wavy, including leaf surface; three-dimensional.

Ungulate A hoofed mammal.

Unicarpellate With a single, free carpel.

Unilocular With a single locule or compartment, as in some ovaries.

Uniparous With only a single branch produced at each branching, such as in some cymes.

Uniseriate In a single row or series.

Unisexual (see **imperfect**).

Urceolate Pitcherlike, hollow, but contracted near the mouth.

Urticating Itch-producing, irritating, and usually rash-producing, as in the hairs in *Cypripedium*.

Utricle A small, thin-walled, one-seeded, inflated dry fruit.

Vallecula (plural **valleculae**) A furrow, groove, or depression.

Vallecular Pertaining to the vallecula or valleys between ridges, as in *Equisetum* stems.

Valvate Opening by sutures that separate the sections of the fruit at maturity, as in loculicidal capsules; a flower in which the petals and/or sepals lie edge to edge along their length, but do not overlap.

Valve One of the segments into which a dehiscent capsule or legume separates.

Variety A unit of classification below the species and subspecies level (q.v.).

Velamen The often thick, spongy, white, water-absorbing layer of epidermis that is dead at maturity and that covers some orchid roots.

Venation The arrangement of the veins of a leaf or petal.

Ventral Lower surface or underside.

Ventricose Inflated or swollen on one side, as in some salvias or penstemons.

Vernation Leaf arrangement in a bud; the configuration of an unopened fern frond.

Vernicose Having a brilliantly polished surface, as some leaves.

Verrucate (see **verrucose**) Slightly reticulate, as in a spore or pollen exine.

Verrucose Covered with wartlike structures.

Versatile Attached near the middle instead of at one end; mobile anthers of this construction, as in many *Lilium*.

Verticil A whorl; an arrangement of similar parts around a central axis.

Verticillaster A pair of axillary cymes arising from opposite leaves or bracts, forming a false whorl.

Vesicle A small inflated structure.

Vespertine Flowering or pollinated during dawn and dusk hours, such as some Onagraceae.

Vessel element A lignified, stout cell wall often with spiral or other inner wall sculpting which conducts water in xylem in higher vascular plants. Many vessel elements have completely open ends.

Vestigial Reduced to a trace of an organ or part, which formerly was much larger or more usefully formed.

Vestiture Collectively, all of the epidermal covering of a plant, including hairs, scales, secretions, and prickles.

Virgate Erect, straight, and slender; usually long and wandlike.

Viscid Sticky, such as in the leaves of *Proboscidea* species.

Viscidium A sticky pad or gluelike substance of a pollinarium which attaches it to a pollinator in the Orchidaceae.

Viscin Gluelike or elasticlike substance.

Vivipary Offspring that develop from germinating seeds or as asexually forming plantlets on the mother plant before dispersal, as in *Rhizophora* or in some grasses and agaves.

Wanting Lacking.

Wetlands Communities that have water as a major component most of the growing year; including swamps and marshes.

Whip leaf A leaf intermediate between a juvenile needle leaf and an adult scale leaf, usually found on "whip" stems in the Cupressaceae.

Whorl A ring of organs or structures.

Whorled Leaves or other structures arranged in a whorl or ring at the same node.

Wing A thin extension bordering an organ; a lateral petal of a papilionaceous (pea) flower.

Woolly Soft, dense, commonly matted hairs.

x The base chromosome number for a plant family or genus. Individual species' chromosome numbers may be identical to or be multiples of this number.

Xeromorphic Exhibiting phenotypic adaptations for a dry environment, such as succulence, dry season deciduousness, etc.

Xylem The system of lignified tubes (dead cell walls) or a formerly active system which conducts water in a vascular plant, usually consisting of tracheids and vessel elements.

Zygomorphic Flowers with a series of parts definitely bilaterally symmetrical, with not all parts in each series alike; usually based on petals unless otherwise stated.

Kenneth D. Heil is a lead field botanist and the supervising editor for this flora of the Four Corners region. Ke received his B.S. in Biology at Fort Lewis College in Durango, Colorado, and his M.S. in Biology from Washington State University in Pullman, Washington. He has been an instructor of biology at Navajo Community College (now Diné College) and is emeritus professor of biology and geology at San Juan College. Ken is the founder and curator of the herbarium (SJNM) at San Juan College and is the author of numerous scientific papers on rare cacti, several books on threatened and endangered species in New Mexico, and the Audubon Society Pocket Field Guide, Familiar Cacti of North America.

Steve L. O'Kane, Jr. is a lead field botanist and coeditor and is a professor in the Department of Biology at the University of Northern Iowa. Steve holds a B.S. in range and forest management, an M.S. in botany, and a Ph.D. in evolutionary and population biology. He teaches courses in plant systematics, evolutionary and ecological theory, ecology, and biogeography, and is the curator of the herbarium (ISTC). His research focuses on the flora of the American West and the molecular systematics of the plant family Brassicaceae.

Linda Mary Reeves is a coeditor and principal illustrator (black and white line drawings) for the flora project. Linda received her B.S. and M.S. in biology at the University of Miami in Coral Gables, and worked for five years on a Ph.D. in Systematic Botany under Don Pinkava at Arizona State University in Tempe. She has published papers on the orchids of Minnesota, as well as orchids of the southwestern United States. She has taught at several colleges and universities and is currently an adjunct instructor at San Juan College.

Arnold Clifford is a field botanist for the Four Corners Flora Project. Arnold's main responsibilities are field collecting and identification of vascular plants throughout the project study area. He is also responsible for locating and determining new plant species and varieties as well as identification of rare and endemic plants. He is an expert on the flora of the Navajo Nation and surrounding areas, and is particularly interested in the flora and geology of laccolithic mountain ranges of the Southwest. Arnold is well known as the discoverer of several plant species new to science.

Ken Heil (front left), Arnold Clifford (rear left), and Steve O'Kane (right) during a plant collection trip to the San Juan Mountains of southern Colorado.
